Architectural Coating	Hauling	0.00	20.0	HHDT
Architectural Coating	Onsite truck	—	—	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	3,624,953	1,208,318	8,100	2,700	34,124

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Grading	—	—	120	0.00	—
Paving	0.00	0.00	0.00	0.00	23.2

5.6.2. Construction Earthmoving Control Strategies

Non-applicable. No control strategies activated by user.

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Single Family Housing	10.1	0%
Fast Food Restaurant with Drive Thru	0.00	0%
Fast Food Restaurant w/o Drive Thru	0.00	0%
High Turnover (Sit Down Restaurant)	0.00	0%
Parking Lot	0.75	100%
City Park	0.00	0%
Other Asphalt Surfaces	11.1	100%
Other Asphalt Surfaces	1.21	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2025	0.00	204	0.03	< 0.005
2026	0.00	204	0.03	< 0.005
2027	0.00	204	0.03	< 0.005
2028	0.00	204	0.03	< 0.005

5.9. Operational Mobile Sources

5.9.1. Unmitigated

Land Use Type	Trips/Weekday	Trips/Saturday	Trips/Sunday	Trips/Year	VMT/Weekday	VMT/Saturday	VMT/Sunday	VMT/Year
Single Family Housing	8,482	8,482	8,482	3,096,047	42,968	42,968	42,968	15,683,177
Fast Food Restaurant with Drive Thru	1,255	1,255	1,255	458,078	3,419	3,419	3,419	1,247,954

Fast Food Restaurant w/o Drive Thru	143	143	143	52,193	390	390	390	142,191
High Turnover (Sit Down Restaurant)	158	158	158	57,668	430	430	430	157,107
Parking Lot	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
City Park	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Other Asphalt Surfaces	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Other Asphalt Surfaces	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

Hearth Type	Unmitigated (number)
Single Family Housing	—
Wood Fireplaces	0
Gas Fireplaces	918
Propane Fireplaces	0
Electric Fireplaces	0
No Fireplaces	0

5.10.2. Architectural Coatings

Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
3624952.5	1,208,318	8,100	2,700	34,124

5.10.3. Landscape Equipment

Season	Unit	Value
Snow Days	day/yr	0.00
Summer Days	day/yr	180

5.11. Operational Energy Consumption

5.11.1. Unmitigated

Electricity (kWh/yr) and CO2 and CH4 and N2O and Natural Gas (kBTU/yr)

Land Use	Electricity (kWh/yr)	CO2	CH4	N2O	Natural Gas (kBTU/yr)
Single Family Housing	7,826,601	204	0.0330	0.0040	26,704,643
Fast Food Restaurant with Drive Thru	96,369	204	0.0330	0.0040	292,442
Fast Food Restaurant w/o Drive Thru	60,230	204	0.0330	0.0040	182,776
High Turnover (Sit Down Restaurant)	60,230	204	0.0330	0.0040	182,776
Parking Lot	28,619	204	0.0330	0.0040	0.00
City Park	0.00	204	0.0330	0.0040	0.00

City Park	Other commercial A/C and heat pumps	R-410A	2,088	< 0.005	4.00	4.00	18.0
City Park	Stand-alone retail refrigerators and freezers	R-134a	1,430	0.04	1.00	0.00	1.00

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

Equipment Type	Fuel Type	Number per Day	Hours per Day	Hours per Year	Horsepower	Load Factor

5.16.2. Process Boilers

Equipment Type	Fuel Type	Number	Boiler Rating (MMBtu/hr)	Daily Heat Input (MMBtu/day)	Annual Heat Input (MMBtu/yr)

5.17. User Defined

Equipment Type	Fuel Type

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

8. User Changes to Default Data

Screen	Justification
Land Use	Lot acreage and square footage adjusted based on Creekside SP land use summary.
Construction: Construction Phases	Phase timing based on applicant provided information. Based on typical construction practices, architectural coating assumed to start two weeks after the start of building construction and last for the same number of days
Construction: Architectural Coatings	Based on EDCAQMD Rule 215.
Operations: Vehicle Data	Trip rates and VMT adjusted based on project-specific traffic report.
Operations: Hearths	Based on applicant provided information, all fireplaces would be natural gas.
Operations: Architectural Coatings	Required by AQ mitigation measure.
Operations: Road Dust	All roads in project vicinity are paved
Construction: On-Road Fugitive Dust	All roads in project area are paved.

CalEEMod Maxmimum Annual Off-Road Equipment GHG Emissions	
Phase	Emissions (MTCO2e/yr)
Building Construction (2026)	284.00
Architectural Coating (2026)	15.80
Total	*299.80*
See Table 3.5 of CalEEMod Report See Table 3.15 of CalEEMod Report	

Emissions from Off-Road Equipment <25 HP	
Equipment	Emissions (MTCO2e/yr)
Generator Sets	12.00
<25 HP equipment is not required to adhere to the CARB Renewable Diesel Fuel Requirements. Thus, MTCO2e emitted from <25 HP equipment is omitted from the reduction calculation below.	
Source: https://ww2.arb.ca.gov/resources/fact-sheets/fact-sheet-renewable-diesel-fuel-requirements	

Total Emissions from Off-Road Equipment >25 HP	*287.80*

Emissions Reduction due to use of Renewable Diesel	**187.07**

Active Adult Option Technical Memorandum (December 2024)

December 5, 2024

To: Anthony Gon, Project Manager
Winn Communities
555 University Avenue, Suite 180
Sacramento, CA 95825

Subject: Creekside Village Specific Plan Project – Active Adult Project Option Technical Memorandum

Dear Mr. Gon:

Raney Planning & Management, Inc. (Raney) has prepared the following technical memorandum to present the emissions that would result from the Active Adult Project Option of the Creekside Village Specific Plan Project (proposed project). This technical memorandum is intended to supersede the original Active Adult Project Option Technical Memorandum that was prepared on June 14, 2024, as this technical memorandum includes the results of the new emissions modeling that was prepared using the California Emissions Estimator Model (CalEEMod) in November 2024.

It is our understanding that under the Active Adult Project Option, 768 units of the 918 proposed single-family residences would be age-restricted units. All other aspects of the project would remain the same. Given the similarities between the proposed project and the Active Adult Project Option, construction emissions, including criteria pollutant emissions and greenhouse gas (GHG) emissions, would remain the same as presented in the April 2024 Creekside Village Air Quality and Greenhouse Gas Impact Analysis. In addition, the results of the construction-related health risk assessment (HRA) conducted as part of the April 2024 Creekside Village Air Quality and Greenhouse Gas Impact Analysis would remain the same.

However, age-restricted households generate fewer trips than traditional households. As such, updated trip generation rates were provided for the Active Adult Project Option by T. Kear Transportation Planning and Management, Inc. (T. Kear). To account for the updated trip generation rates, operational emissions associated with the Active Adult Project Option were estimated using the CalEEMod version 2022.1.1.29.

The maximum unmitigated operational criteria pollutant emissions for the Active Adult Project Option, as compared to the proposed project, are presented in Table 1.

Table 1
Maximum Unmitigated Operational Emissions (lbs/day)

	ROG	NO_X
Proposed Project Emissions	100	51.2
Active Adult Project Option Emissions	84.9	47.4
Reduction	*-15.1*	*-3.8*
EDCAQMD Significance Threshold	**82.0**	**82.0**
Exceeds Threshold?	**YES**	**NO**

Source: CalEEMod, November 2024 (see Attachment A).

As shown in the table, the Active Adult Project Option would result in a reduction in operational ROG and NO_X emissions as compared to the proposed project. However, while NO_x emissions

would remain below the applicable EDCAQMD threshold of significance, ROG emissions would still exceed the applicable EDCAQMD threshold of significance. Therefore, Mitigation Measure AQ-1 included in the April 2024 Creekside Village Air Quality and Greenhouse Gas Impact Analysis (carried forward as Mitigation Measures AQ-1 through AQ-4 included in the Air Quality Chapter of the Draft EIR prepared for the proposed project) would still be required under the Active Adult Project Option, and, similar to the proposed project, the Active Adult Project Option would result in a ***significant and unavoidable*** impact associated with operational criteria pollutant emissions.

It should also be noted that maximum unmitigated operational GHG emissions associated with the Active Adult Project Option would be 9,487 metric tons of carbon dioxide equivalents per year ($MTCO_2e$/yr), which is a reduction of 247 $MTCO_2e$/yr compared to the 9,761 $MTCO_2e$/yr associated with operation of the proposed project. Impacts related to operational GHG emissions associated with the proposed project were analyzed within the April 2024 Creekside Village Air Quality and Greenhouse Gas Impact Analysis using the Sacramento Metropolitan Air Quality Management District's (SMAQMD's) qualitative best management practice (BMP)-based thresholds of significance. Given the similarities of the proposed project and the Active Adult Project Option, consistency with SMAQMD BMP-1 and BMP-2 cannot be ensured at this time. As such, even with the reduction in GHG emissions, because the project analysis is based on SMAQMD's qualitative BMP-based thresholds of significance, impacts associated with operational GHG emissions would remain the same as presented in the April 2024 Creekside Village Air Quality and Greenhouse Gas Impact Analysis, and Mitigation Measure GHG-1 included therein (carried forward as Mitigation Measures GHG-1 and GHG-2 included in the Greenhouse Gas Emissions Chapter of the Draft EIR prepared for the proposed project) would still be required.

If you have any questions regarding the contents of this document, please do not hesitate to contact me at (916) 372-6100, or via email at rods@raneymanagement.com.

Best Regards,

Rod Stinson
Vice President/Air Quality Specialist

8. User Changes to Default Data

Screen	Justification
Land Use	Lot acreage and square footage adjusted based on Creekside SP land use summary.
Construction: Construction Phases	Phase timing based on applicant provided information. Based on typical construction practices, architectural coating assumed to start two weeks after the start of building construction and last for the same number of days
Construction: Architectural Coatings	Based on EDCAQMD Rule 215.
Operations: Vehicle Data	Trip rates and VMT adjusted based on project-specific traffic report.
Operations: Hearths	All units would have natural gas fireplaces per applicant's AQ questionnaire.
Operations: Architectural Coatings	Based on EDCAQMD Rule 215.
Operations: Road Dust	All roads in project vicinity are paved
Construction: On-Road Fugitive Dust	All roads in project area are paved.

Reduced Impact Alternative Technical Memorandum (December 2024)

December 5, 2024

To: Anthony Gon, Project Manager
Winn Communities
555 University Avenue, Suite 180
Sacramento, CA 95825

Subject: Creekside Village Specific Plan Project – Reduced Impact Alternative Technical Memorandum

Dear Mr. Gon:

Raney Planning & Management, Inc. (Raney) has prepared the following technical memorandum to present the emissions that would result from the Reduced Impact Alternative of the Creekside Village Specific Plan Project.

It is our understanding that under the Reduced Impact Alternative, the proposed project would be revised to include 150 single-family residences, 613 age-restricted single-family residences, and 14.1 acres of parkland. In addition, the portion of the site originally designated for neighborhood commercial uses would no longer be developed with such uses, and instead, would be developed with a 1.58-acre park. The remainder of the project site would still be proposed for open space and roadway infrastructure improvements. However, the Reduced Impact Alternative would result in an overall increase in disturbance of 1.74 acres as compared to the proposed project.

In addition, it should be noted that due to a reduction in the unit count, the off-site intersection improvements at Latrobe Road and Town Center Boulevard and at the Avanti Drive/Latrobe Road intersection would not be required under the Reduced Impact Alternative, and while the Royal Oaks/Latrobe Road intersection would require signalization, road widening at the intersection would not be required under the Reduced Impact Alternative. All other aspects of the project would remain the same.

To account for the revisions to the proposed project that would occur as a result of the Reduced Impact Alternative, construction and operational emissions associated with the Reduced Impact Alternative were estimated using the California Emissions Estimator Model (CalEEMod) version 2022.1.1.29. The results of the updated modeling are presented below.

Construction Emissions

The following discussions include an analysis of the updated criteria pollutant emissions, health risks, and greenhouse gas (GHG) emissions that would occur as a result of construction of the Reduced Impact Alternative.

Criteria Pollutant Emissions

The maximum unmitigated construction criteria pollutant emissions for the Reduced Impact Alternative, as compared to the proposed project, are presented in Table 4. As shown in the table, the Reduced Impact Alternative would result in a slight decrease in construction-related ROG emissions, and the same amount of construction-related NO_X emissions as compared to the proposed project. Similar to the proposed project, ROG and NO_x emissions would be below the applicable EDCAQMD thresholds of significance. Therefore, the Reduced Impact Alternative

would result in a ***less-than-significant*** impact associated with construction-related criteria pollutant emissions.

Table 1
Maximum Unmitigated Construction Emissions (lbs/day)

	ROG	NO_X
Proposed Project Emissions	50.51	33.29
Reduced Impact Alternative Emissions	50.21	33.29
Difference	*-0.30*	*0.00*
EDCAQMD Significance Threshold	**82.0**	**82.0**
Exceeds Threshold?	**NO**	**NO**

Source: CalEEMod, November 2024 (see Attachment A).

Construction Health Risk Assessment

Using similar methodology as described in the April 2024 Creekside Village Air Quality and Greenhouse Gas Impact Analysis, the cancer risk and non-cancer hazard indices associated with the Reduced Impact Alternative were estimated for the maximally-exposed receptor. The cancer risk and non-cancer hazard indices associated with the Reduced Impact Alternative, as compared to the proposed project, are presented in Table 2.

Table 2
Maximum Unmitigated Cancer Risk and Hazard Index Associated with Project Construction DPM

	Cancer Risk (per million persons)	Acute Hazard Index	Chronic Hazard Index
Proposed Project Construction DPM Health Risks	2.06	0.00	0.001
Reduced Impact Alternative Construction DPM Health Risks	1.93	0.00	0.001
Difference	*-0.13*	*0.00*	*0.00*
Thresholds of Significance	**10**	**1.0**	**1.0**
Exceed Thresholds?	**NO**	**NO**	**NO**

Source: AERMOD and HARP 2 RAST, November 2024 (see Attachment B).

As shown in Table 2, the Reduced Impact Alternative would result in a slight decrease in construction-related cancer risks, and the same amount of construction-related chronic and acute hazard index risks as compared to the proposed project. Similar to the proposed project, construction of the Reduced Impact Alternative would not result in any health impacts in excess of the EDCAQMD's standards. Therefore, the Reduced Impact Alternative would result in a ***less-than-significant*** impact.

Greenhouse Gas Emissions

The maximum unmitigated construction GHG emissions for the Reduced Impact Alternative, as compared to the proposed project, are presented in Table 3. As shown in the table, maximum GHG emissions related to construction of the proposed project would be below the applicable threshold of significance. Therefore, similar to the proposed project, construction of the Reduced Impact Alternative would not be considered to result in a cumulatively considerable contribution to global climate change during construction activities, and a ***less-than-significant*** impact would occur.

Table 3
Maximum Unmitigated Construction GHG Emissions

	GHG Emissions ($MTCO_2e$/yr)
Proposed Project Emissions	997.33
Reduced Impact Alternative Emissions	846.33
Difference	-151.00
SMAQMD Threshold	**1,100.00**
Exceeds Threshold?	**NO**

Source: CalEEMod, November 2024 (see Appendix A).

Operational Emissions

The following discussions include an analysis of the updated operational criteria pollutant emissions and GHG emissions that would occur as a result of the Reduced Impact Alternative.

Criteria Pollutant Emissions

The maximum unmitigated operational criteria pollutant emissions for the Reduced Impact Alternative, as compared to the proposed project, are presented in Table 4.

Table 4
Maximum Unmitigated Operational Emissions (lbs/day)

	ROG	NO_X
Proposed Project Emissions	100	51.2
Reduced Impact Alternative Emissions	62.6	26.9
Reduction	*-37.4*	*-24.3*
EDCAQMD Significance Threshold	**82.0**	**82.0**
Exceeds Threshold?	**NO**	**NO**

Source: CalEEMod, November 2024 (see Attachment A).

As shown in the table, the Reduced Impact Alternative would result in a reduction in operational ROG and NO_X emissions as compared to the proposed project. In addition, ROG and NO_x emissions would be below the applicable EDCAQMD thresholds of significance. Therefore, Mitigation Measure AQ-1 included in the April 2024 Creekside Village Air Quality and Greenhouse Gas Impact Analysis (carried forward as Mitigation Measures AQ-1 through AQ-4 included in the Air Quality Chapter of the Draft EIR prepared for the proposed project) would not be required under the Reduced Impact Alternative and the Reduced Impact Alternative would result in a ***less-than-significant*** impact associated with operational criteria pollutant emissions.

Greenhouse Gas Emissions

Maximum unmitigated operational GHG emissions associated with the Reduced Impact Alternative would be 4,671 metric tons of carbon dioxide equivalents per year ($MTCO_2e$/yr), which is a reduction of 5,090 $MTCO_2e$/yr compared to the 9,761 $MTCO_2e$/yr associated with operation of the proposed project. Impacts related to operational GHG emissions associated with the proposed project were analyzed within the April 2024 Creekside Village Air Quality and Greenhouse Gas Impact Analysis using the Sacramento Metropolitan Air Quality Management District's (SMAQMD's) qualitative best management practice (BMP)-based thresholds of significance. Given the similarities of the proposed project and the Reduced Impact Alternative, consistency with SMAQMD BMP-1 and BMP-2 cannot be ensured at this time. As such, even with the reduction in GHG emissions, because the project analysis is based on SMAQMD's qualitative BMP-based thresholds of significance, impacts associated with operational GHG emissions would remain the same as presented in the April 2024 Creekside Village Air Quality and

Greenhouse Gas Impact Analysis, and Mitigation Measure GHG-1 included therein (carried forward as Mitigation Measures GHG-1 and GHG-2 included in the Greenhouse Gas Emissions Chapter of the Draft EIR prepared for the proposed project) would still be required. Nonetheless, similar to the proposed project, with implementation of the aforementioned mitigation measures, the Reduced Impact Alternative would result in a ***less-than-significant*** impact related to operational GHG emissions.

Conclusion

Based on the above, the Reduced Impact Alternative would result in similar or reduced impacts related to air quality and GHG emissions as compared to the proposed project. Under the Reduced Impact Alternative, all impacts related to air quality and GHG emissions would be ***less than significant***.

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Creekside Village Specific Plan - Reduced Impacts Alternative
Construction Start Date	6/2/2025
Operational Year	2028
Lead Agency	El Dorado County
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	9.40
Location	38.61348203944053, -121.05086586387135
County	El Dorado-Mountain County
City	Unincorporated
Air District	El Dorado County AQMD
Air Basin	Mountain Counties
TAZ	470
EDFZ	4
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.29

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Single Family Housing	150	Dwelling Unit	21.3	292,500	125,602	—	381	—

Single Family Housing	613	Dwelling Unit	117	1,195,350	689,398	—	1,557	Age-Restricted Units
City Park	14.1	Acre	14.1	0.00	613,760	613,760	—	—
Other Asphalt Surfaces	11.1	Acre	11.1	0.00	0.00	—	—	—
Other Asphalt Surfaces	39.3	1000sqft	0.90	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

5. Activity Data

5.1. Construction Schedule

Phase Name	Phase Type	Start Date	End Date	Days Per Week	Work Days per Phase	Phase Description
Grading	Grading	6/2/2025	7/25/2025	5.00	40.0	—
Building Construction	Building Construction	10/18/2025	7/21/2028	5.00	720	—
Paving	Paving	7/26/2025	10/17/2025	5.00	60.0	—
Architectural Coating	Architectural Coating	11/1/2025	8/4/2028	5.00	720	—

5.2. Off-Road Equipment

5.2.1. Unmitigated

Phase Name	Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor
Grading	Graders	Diesel	Average	1.00	8.00	148	0.41

Grading	Excavators	Diesel	Average	2.00	8.00	36.0	0.38
Grading	Tractors/Loaders/Backhoes	Diesel	Average	2.00	8.00	84.0	0.37
Grading	Scrapers	Diesel	Average	2.00	8.00	423	0.48
Grading	Rubber Tired Dozers	Diesel	Average	1.00	8.00	367	0.40
Building Construction	Forklifts	Diesel	Average	3.00	8.00	82.0	0.20
Building Construction	Generator Sets	Diesel	Average	1.00	8.00	14.0	0.74
Building Construction	Cranes	Diesel	Average	1.00	7.00	367	0.29
Building Construction	Welders	Diesel	Average	1.00	8.00	46.0	0.45
Building Construction	Tractors/Loaders/Backhoes	Diesel	Average	3.00	7.00	84.0	0.37
Paving	Pavers	Diesel	Average	2.00	8.00	81.0	0.42
Paving	Paving Equipment	Diesel	Average	2.00	8.00	89.0	0.36
Paving	Rollers	Diesel	Average	2.00	8.00	36.0	0.38
Architectural Coating	Air Compressors	Diesel	Average	1.00	6.00	37.0	0.48

5.3. Construction Vehicles

5.3.1. Unmitigated

Phase Name	Trip Type	One-Way Trips per Day	Miles per Trip	Vehicle Mix
Grading	—	—	—	—
Grading	Worker	20.0	14.3	LDA,LDT1,LDT2
Grading	Vendor	—	8.80	HHDT,MHDT
Grading	Hauling	0.00	20.0	HHDT
Grading	Onsite truck	—	—	HHDT
Building Construction	—	—	—	—
Building Construction	Worker	275	14.3	LDA,LDT1,LDT2
Building Construction	Vendor	81.6	8.80	HHDT,MHDT
Building Construction	Hauling	0.00	20.0	HHDT

Building Construction	Onsite truck	—	—	HHDT
Paving	—	—	—	—
Paving	Worker	15.0	14.3	LDA,LDT1,LDT2
Paving	Vendor	—	8.80	HHDT,MHDT

Architectural Coating	Onsite truck	—	—	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	3,624,953	1,208,318	8,100	2,700	34,124

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Grading	—	—	120	0.00	—
Paving	0.00	0.00	0.00	0.00	20.4

5.6.2. Construction Earthmoving Control Strategies

Non-applicable. No control strategies activated by user.

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Single Family Housing	1.65	0%
Single Family Housing	6.75	0%
City Park	0.00	0%
Other Asphalt Surfaces	11.1	100%
Other Asphalt Surfaces	0.90	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2025	0.00	204	0.03	< 0.005
2026	0.00	204	0.03	< 0.005
2027	0.00	204	0.03	< 0.005
2028	0.00	204	0.03	< 0.005

5.9. Operational Mobile Sources

5.9.1. Unmitigated

Land Use Type	Trips/Weekday	Trips/Saturday	Trips/Sunday	Trips/Year	VMT/Weekday	VMT/Saturday	VMT/Sunday	VMT/Year
Single Family Housing	1,436	1,436	1,436	523,958	5,954	5,954	5,954	2,173,220
Single Family Housing	2,164	2,164	2,164	789,820	8,975	8,975	8,975	3,275,938
City Park	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

Other Asphalt Surfaces	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Other Asphalt Surfaces	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

Hearth Type	Unmitigated (number)
Single Family Housing	—
Wood Fireplaces	0
Gas Fireplaces	150
Propane Fireplaces	0
Electric Fireplaces	0
No Fireplaces	0
Wood Fireplaces	0
Gas Fireplaces	613
Propane Fireplaces	0
Electric Fireplaces	0
No Fireplaces	0

5.10.2. Architectural Coatings

Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
3624952.5	1,208,318	8,100	2,700	34,124

5.10.3. Landscape Equipment

Season	Unit	Value
Snow Days	day/yr	0.00
Summer Days	day/yr	180

5.11. Operational Energy Consumption

5.11.1. Unmitigated

Electricity (kWh/yr) and CO2 and CH4 and N2O and Natural Gas (kBTU/yr)

Land Use	Electricity (kWh/yr)	CO2	CH4	N2O	Natural Gas (kBTU/yr)
Single Family Housing	1,278,856	204	0.0330	0.0040	4,363,504
Single Family Housing	5,226,260	204	0.0330	0.0040	17,832,186
City Park	0.00	204	0.0330	0.0040	0.00
Other Asphalt Surfaces	0.00	204	0.0330	0.0040	0.00
Other Asphalt Surfaces	0.00	204	0.0330	0.0040	0.00

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

Land Use	Indoor Water (gal/year)	Outdoor Water (gal/year)
Single Family Housing	4,797,743	1,647,470
Single Family Housing	19,606,774	9,042,554
City Park	0.00	14,637,165
Other Asphalt Surfaces	0.00	0.00
Other Asphalt Surfaces	0.00	0.00

5.13. Operational Waste Generation

5.13.1. Unmitigated

Land Use	Waste (ton/year)	Cogeneration (kWh/year)
Single Family Housing	83.6	—
Single Family Housing	342	—
City Park	1.21	—
Other Asphalt Surfaces	0.00	—
Other Asphalt Surfaces	0.00	—

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

Land Use Type	Equipment Type	Refrigerant	GWP	Quantity (kg)	Operations Leak Rate	Service Leak Rate	Times Serviced
Single Family Housing	Average room A/C & Other residential A/C and heat pumps	R-410A	2,088	< 0.005	2.50	2.50	10.0
Single Family Housing	Household refrigerators and/or freezers	R-134a	1,430	0.12	0.60	0.00	1.00
Single Family Housing	Average room A/C & Other residential A/C and heat pumps	R-410A	2,088	< 0.005	2.50	2.50	10.0
Single Family Housing	Household refrigerators and/or freezers	R-134a	1,430	0.12	0.60	0.00	1.00
City Park	Other commercial A/C and heat pumps	R-410A	2,088	< 0.005	4.00	4.00	18.0
City Park	Stand-alone retail refrigerators and freezers	R-134a	1,430	0.04	1.00	0.00	1.00

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

Equipment Type	Fuel Type	Number per Day	Hours per Day	Hours per Year	Horsepower	Load Factor

5.16.2. Process Boilers

Equipment Type	Fuel Type	Number	Boiler Rating (MMBtu/hr)	Daily Heat Input (MMBtu/day)	Annual Heat Input (MMBtu/yr)

5.17. User Defined

Equipment Type	Fuel Type

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

8. User Changes to Default Data

Screen	Justification
Land Use	Lot acreage and square footage adjusted based on land use summary and tentative map provided by project applicant.
Construction: Construction Phases	Phase timing based on applicant provided information. Based on typical construction practices, architectural coating assumed to start two weeks after the start of building construction and last for the same number of days
Construction: Architectural Coatings	Based on EDCAQMD Rule 215.
Operations: Vehicle Data	Trip rates and VMT adjusted based on project-specific traffic report.
Operations: Hearths	All units would have natural gas fireplaces per applicant's AQ questionnaire.
Operations: Architectural Coatings	Based on EDCAQMD Rule 215.
Operations: Road Dust	All roads in project vicinity are paved
Construction: On-Road Fugitive Dust	All roads in project area are paved.

CREEKSIDE VILLAGE
Biological Resources Constraints Report

Introduction

This report analyzes biological resource constraints associated with the Creekside Village Project (project). The study area for this report comprises the main residential development project site and offsite locations including a sewer force main alignment along Latrobe Road and intersection improvements located in the unincorporated community of El Dorado Hills in western El Dorado County, California (**Figures 1** and **2**). The purpose is to document existing special-status biological resources on the project site as well as provide information on potential regulatory constraints associated with implementation of the proposed project. This report is intended to support the preparation of a California Environmental Quality Act (CEQA) environmental document and other regulatory compliance documents that may be needed.

This report identifies the existing biological resources at the project site; identifies the federal, state, and local regulations pertaining to biological resources within the region; and describes potential project impacts on those biological resources as well as mitigation measures to reduce project-related impacts. The information and analysis presented in this report is focused on special-status species,[1] wildlife habitats, vegetation communities, and aquatic resources that may qualify as waters of the U.S. or State. The results of the assessment presented in this report are based upon literature review and queries of the California Department of Fish and Wildlife's (CDFW) Natural Diversity Database (CNDDB), the U.S. Fish and Wildlife Service's (USFWS) list of federal endangered and threatened species, and the California Native Plant Society's (CNPS) Inventory of Rare and Endangered Plants, as well as surveys conducted at the project site. Biological resources within the project site were identified through field reconnaissance surveys conducted in August 2019, December 2020, January 2021, and April 2022.

[1] Species that are regulated pursuant to federal or state endangered species laws, or have been designated as Species of Special Concern by the CDFW, or species that are not included on any agency listing but meet the definition of rare, endangered or threatened species of the CEQA Guidelines section 15380(b), are collectively referred to as "special-status species".

Figure 2
Project Site

Project Location

The project site is located in southwestern El Dorado Hills in western El Dorado County, just east of the City of Folsom, California. The main project area is located south of the intersection of Latrobe Road and Investment Boulevard and is on the Folsom SE, California U.S. Geological Survey (USGS) 7.5-minute series quadrangle. The project includes the installation of a sewer force main within the alignment of Latrobe Road extending approximately 1.8 miles north of the main project site to the El Dorado Hills Wastewater Treatment Plant.

Data Sources/Methodology

Biological resources within the project site were identified by ESA biologists Erich Fischer, Joshua Boldt, and Chuck Hughes through field reconnaissance surveys conducted on August 20, 2019, December 10, 2020, January 13, 2021, and April 19, 2022. Prior to the surveys, a review of pertinent literature and database queries was conducted for the project site. Database queries were updated to identify any changes. The primary sources of data referenced for this report include the following:

- Folsom SE and Clarksville, California USGS 7.5-minute topographic quadrangle maps;
- Google Earth color aerial photography for vegetative, topographic, and hydrographic signatures (Google Inc., 2021);
- USFWS list of federal endangered and threatened species that may occur in the proposed project location, and/or may be affected by the project (USFWS, 2023a) (see **Appendix A**);
- CNDDB (v 5.3.0) list of special-status species occurrences within the Folsom SE, California and eight surrounding USGS 7.5-minute topographic quadrangles (Folsom, Clarksville, Shingle Springs, Buffalo Creek, Latrobe, Sloughhouse, Carbondale, and Irish Hill) (CDFW, 2023a) (see Appendix A);
- CNPS Inventory of Rare and Endangered Plants (v9.5) known to occur within the Folsom SE, California and eight surrounding USGS 7.5-minute topographic quadrangles (CNPS, 2023) (see Appendix A);
- USFWS Critical Habitat for Threatened and Endangered Species (online mapping program) (USFWS, 2023b);
- National Wetlands Inventory (USFWS, 2021c);
- CDFW Special Vascular Plants, Bryophytes, and Lichens List (CDFW, 2023b); and
- CDFW Special Animals List (CDFW, 2023c).

During the biological surveys, ESA biologists walked meandering transects through the entire project site, spaced closely to obtain maximum visual coverage of the habitats present. Existing habitat types, plants, and wildlife species within and adjacent to the project site were recorded. Vegetation communities and wildlife habitats were identified and mapped using aerial photo interpretation and field reconnaissance. Prior to the field surveys, special-status species characteristics and habitat requirements were reviewed to aid in field recognition of suitable habitats. During the surveys, habitats were evaluated for their potential to support regionally

occurring special-status species and the presence of any other biologically sensitive resources such as wetlands, riparian habitat, or drainages. Based on the information collected, ESA identified specific biological constraints that could potentially be encountered by implementation of the proposed project.

Environmental Setting

Regional Setting

The project site is in western El Dorado County south of the community of El Dorado Hills. Regionally, the site is located in the Sierra Nevada foothills, just west of the Sierra Nevada Range, within the northern Sierra Nevada Foothills District of the California Floristic Province (Baldwin et al., 2012). Regional natural vegetation communities in the vicinity of the project site include those that are prevalent to the Sierra Nevada foothills, such as annual grasslands, blue oak woodlands, chamise chaparral, and mixed oak/foothill pine woodlands.

The overall climate in the region is Mediterranean in nature, which is characterized by hot, dry summers and cool, wet winters, with the bulk of precipitation occurring as rain in the winter months. The climate in the El Dorado Hills area is temperate with mean annual precipitation of 25.80 inches and mean annual temperatures ranging from a high of 74 to a low of 50 degrees Fahrenheit (Western Regional Climate Center, 2021). Topography throughout the project site drains generally from east to west and is characterized by rolling hills and slopes. The elevation within the project site ranges from approximately 476 feet in the west to 642 feet on a hill in the south.

Plant Communities and Wildlife Habitats

Wildlife habitats are generally described in terms of vegetation types along with landform, disturbance regime, and other unique environmental characteristics. Vegetation communities are assemblages of plant species that occur together in the same area, are repeated across landscapes, and are defined by species composition and relative abundance. Wildlife habitats generally correspond to vegetation communities. The wildlife habitat types described in this document were classified using the CDFW's *A Guide to Wildlife Habitats of California* (Mayer and Laudenslayer, 1988), a habitat classification scheme that was developed to support the CDFW's California Wildlife Habitat Relationship (CWHR) System. The CWHR System is a wildlife information system and predictive model for California's regularly-occurring wildlife species. The vegetation types described in this report were classified according to *A Manual of California Vegetation, 2nd Edition* (Sawyer et al., 2009). Within CDFW's current vegetation classification system, vegetation alliances are the scientifically derived hierarchical class that corresponds best with plant communities and are designed to be the unit for conservation of rare or threatened plant communities. Vegetation alliances typically represent a much finer scale of vegetation description than wildlife habitats, but correspond approximately with one or several wildlife habitat types. CDFW provides crosswalks to help correlate vegetation alliances with wildlife habitats and the descriptions below make use of the crosswalk. A description of each wildlife habitat type is presented below. Related vegetation alliances are listed following the wildlife habitat description and are based on the alliance descriptions presented by Sawyer, et al. (2009). Vegetation alliances considered a Sensitive Natural Community by CDFW are marked below by

an asterisk (*) and should therefore be considered a sensitive natural community under CEQA regulations. Plant nomenclature follows *The Jepson Manual: Vascular Plants of California (Second Edition)* (Baldwin et al., 2012) as revised by the Jepson eFlora (Jepson Flora Project, 2023). Common names of plant species are derived from the Jepson Manual or Calflora (2023). **Table 1** and **Figure 3** summarize the extent of wildlife habitats that occur within the project site.

TABLE 1
HABITAT TYPES

Habitat Type	Total Area (acres)	Offsite Area (acres	Project Site (acres)
Annual Grassland	208.85	7.26	201.59
Blue Oak Woodland	0.75	-	0.75
Culvert (Riverine)	0.04	0.04	<0.01
Developed/Disturbed	29.49	28.95	0.54
Ephemeral Drainage (Riverine)	1.32	<0.01	1.31
Intermittent Drainage (Riverine)	1.20	0.09	1.12
Perennial Drainage (Riverine)	0.30	0.30	-
Seasonal Wetland (including Seep, Wetland Swale, Riverine Seasonal Wetland, and Seasonal Wetland)	2.82	0.09	2.73
Valley Foothill Riparian	1.52	0.50	1.02
Vernal Pool	0.07	-	0.07
Total	**246.35**	**37.23**	**209.12**

NOTE: Total may not sum due to rounding.

Terrestrial Habitats

Annual Grassland

Annual grassland, the most abundant habitat type in the project site, is an annual herbaceous plant community characterized mostly by naturalized annual grasses. In the project site, annual grassland is dominated by naturalized herbaceous annual grasses and forbs, with smaller patches with relatively high proportions of native grasses and forbs. The most abundant species in this community include non-native grasses such as wild oats (*Avena barbata, A. fatua, A. sativa*), bromes (*Bromus diandrus, B. hordeaceus*), barleys (*Hordeum marinum* subsp. *gussoneanum, H. murinum*), and fescues (*Festuca myuros, F. perennis*); non-native weedy herbaceous species including yellow star-thistle (*Centaurea solstitialis*), tall sock-destroyer (*Torilis arvensis*), Italian thistle (*Carduus pycnocephalus* subsp. *pycnocephalus*), vetch (*Vicia villosa, V. sativa* subsp. *sativa*), California burclover (*Medicago polymorpha*), broad-leaf filaree (*Erodium botrys*), black mustard (*Brassica nigra*), and shortpod mustard (*Hirschfeldia incana*); and native herbaceous species such as narrow tarplant (*Holocarpha virgata* subsp. *virgata*), yarrow (*Achillea millefolium*), and spikeweed (*Centromadia fitchii*). The native perennial purple needle grass (*Stipa pulchra*) was observed in the project site, but was not present in sufficient density to be considered a separate habitat.

Creekside Village

Figure 3
Habitat

Annual grassland contains a mosaic of important wildlife habitat features that may provide cover, foraging, and breeding habitat for a variety of wildlife species. Common wildlife species that use annual grassland include western fence lizard (*Sceloporus occidentalis*), common garter snake (*Thamnophis sirtalis*), California ground squirrel (*Otospermophilus beecheyi*), black-tailed jackrabbit (*Lepus californicus*), coyote (*Canis latrans*), mule deer (*Odocoileus hemionus californicus*), western meadowlark (*Sturnella neglecta*), American crow (*Corvus brachyrhynchos*), mourning dove (*Zenaida macroura*), and a variety of raptors such as northern harrier (*Circus cyaneus*), red-tailed hawk (*Buteo jamaicensis*), and American kestrel (*Falco sparverius*).

Vegetation Alliances

- *Avena* (*barbata, fatua*) (44.150.00) Wild oats grassland
- *Bromus* (*diandrus, hordeaceus*) (42.026.00) Annual brome grassland
- *Festuca perennis* (41.321.00) Perennial ryegrass fields

Blue Oak Woodland

There is small grove of blue oaks (*Quercus douglasii*) in the southeast corner of the site. Annual grassland is found in the understory of this grove and surrounds the grove on all sides. The grove is located on the top of a steep rise, approximately 100 feet above the rest of the site. The trees were generally in fair to good condition and ranged in size from 18 to 24 inches in diameter at breast height (DBH). Oak trees provide nesting and foraging habitat for many species, including acorn woodpecker (*Melanerpes formicivorus*), yellow-billed magpie (*Pica nuttalli*), and gray squirrel (*Sciurus griseus*).

Vegetation Alliances

- *Quercus douglasii* (71.020.00) Blue oak woodland

Developed/Disturbed

Developed portions of the project site include paved roads, sidewalks, parking lots, and associated infrastructure. These areas are paved or otherwise developed and generally lack natural vegetation. Vegetation associated with developed areas may consist of ornamental shrubs and trees or ruderal roadside vegetation. Disturbed areas include roadsides and other areas with continuous disturbance which limits the establishment of vegetation. Plant species adapted to frequent disturbance observed in the disturbed areas include: stinkwort (*Dittrichia graveolens*), Russian thistle (*Salsola tragus*), short-pod mustard (*Hirschfeldia incana*), and yellow starthistle (*Centaurea solstitialis*). Plant cover is extremely sparse; few individuals are established within the disturbed area. As such, no vegetation alliances correlate with the disturbed type.

Ornamental vegetation associated with developed areas provides marginal habitat for wildlife species. Species expected to occur in these areas include Brewer's blackbird (*Euphagus cyanocephalus*), European starling (*Sturnus vulgaris*), house sparrow (*Passer domesticus*), rock dove (*Columba livia*), and white-crowned sparrow (*Zonotrichia leucophrys*).

Vegetation Alliances

- None

Wetland and Aquatic Habitats

Riverine

Riverine habitats are distinguished by ephemeral, intermittent, or continually running water, and occur in association with a variety of terrestrial habitats. Carson Creek, a perennial channel, is the largest riverine habitat feature within the study area. This feature flows year-round under typical climatic conditions. All features in the study area eventually drain to Carson Creek. The remaining drainage features in the study area are intermittent or ephemeral in nature and do not support flowing water year-round. Drainage features in the project site consist of perennial, intermittent, and ephemeral channels as well as man-made ditches and culverts. A perennial channel is a stream, or stream portion, that flows continuously during the calendar year. An intermittent channel has flowing water during certain times of the year, when precipitation or groundwater provides water for stream flow. During dry periods, intermittent streams may not have flowing water. In the project site, intermittent channels generally flow throughout the winter season and into the late spring or early summer. An ephemeral channel has flowing water only during, and for a short duration after, precipitation events in a typical year. Ephemeral stream beds are located above the water table year-round. Groundwater is not a source of water for the stream. Runoff from rainfall is the primary source of water for stream flow. This habitat type also includes a man-made drainage ditch in the northwestern corner of the site. The shallow, graded ditch drains the adjacent parking lots to the north. Culverted portions of natural stream channels are also included in this habitat type. Irrigation runoff from developed areas may contribute flows to otherwise natural channels.

Vegetation Alliances

- None

Seasonal Wetlands

Seasonal Wetland/Seep/Wetland Swale/Riverine Seasonal Wetland

These habitat types are discussed collectively due to the similarities in their vegetation composition, substrate, and hydrologic conditions. These communities exhibit variable hydrologic conditions but annually pond surface water or maintain saturated soils at the ground surface for long enough each year to support facultative or obligate wetland plant species. These wetlands support ponded or saturated soil conditions during winter and spring and are typically dry through the summer and fall. Vegetation is characterized by both annual and perennial species including native and non-native grasses and forbs. Plant species found within these wetlands are adapted to withstand intermittent periods of inundation, and typically initiate growth as aquatic or semi-aquatic plants and transition to a dry-land environment as the wetlands dries. Upland grasses and forbs often establish after wetland species desiccate and features become dry. Within the project site, these wetlands occur in depressions, swales, drainages, seeps, or low areas within annual grassland habitat. These communities are dominated by Mediterranean barley (*Hordeum marinum* subsp. *gussoneanum*), rye grass (*Festuca perennis*), rabbitsfoot grass (*Polypogon monspeliensis*), curly dock (*Rumex crispus*), and common toad rush.

Wildlife species use seasonal wetlands for temporary water sources and cover. Species expected to occur in this habitat type are similar to those expected to occur in the annual grassland habitat

discussed above. Seasonal wetlands may also support invertebrate communities that thrive in inundated conditions as discussed below under venal pool.

Vegetation Alliances

- *Festuca perennis* (41.321.00) Perennial ryegrass fields

Valley Foothill Riparian

The vegetation of riparian habitats is quite variable and often structurally diverse. Usually, riparian habitat occurs along streambanks and lakeshores as a narrow, often dense grove of broad-leaved, winter deciduous trees with a subcanopy tree layer and an understory shrub layer. In the project site, characteristic species include Goodding's black willow (*Salix gooddingii*), Fremont cottonwood (*Populus fremontii*), and red willow (*Salix laevigata*) trees in the overstory. The understory consists of sandbar willow (*Salix exigua*) and Himalayan blackberry (*Rubus armeniacus*), and a variety of grasses and forbs, including miner's lettuce (*Claytonia perfoliata*) and rye grass.

All riparian habitats have an exceptionally high value for many wildlife species. Such areas provide water, thermal cover, migration corridors, and diverse nesting and feeding opportunities. The shape of many riparian zones, particularly the linear nature of streams, maximizes the development of the ecotone (a region of transition between two biological communities), which is highly productive for wildlife. A wide range of amphibians, reptiles, birds, and mammals utilize montane riparian habitat for food, cover, and reproduction.

Vegetation Alliances

- *Salix exigua* (61.209.00) Sandbar willow thickets (S4)
- *Salix gooddingii* (61.211.01) Goodding's willow thickets (S3)*

Vernal Pool

Vernal pools are seasonal wetlands that occur in grasslands. These wetlands are typically found in slight depressions that form over bedrock or hardpan soils that allow water to pool during winter and spring rains. Vernal pools typically have an impervious layer of silicate-based hardpan underlying them that prevents water from percolating into the soil. Vernal pools are considered unique habitat and often support species that are endemic to vernal pools or other shallow pools in that particular geographic region. Vernal pool communities have been greatly reduced due to conversion of grasslands to agriculture or urban development. In the project site, vernal pools are dominated by species common to vernal pools including coyote-thistle (*Eryngium castrense*), common toad rush (*Juncus bufonius*), and popcornflower (*Plagiobothrys* sp.).

Vernal pools support invertebrate communities that thrive in inundated conditions. Invertebrate species that potentially occur in vernal pools within the project site include common and special-status species such as clam shrimp (*Cyzicus californicus*), seed shrimp (*Cypria* sp.), vernal pool fairy shrimp (*Branchinecta lynchi*), vernal pool tadpole shrimp (*Lepidurus packardi*), and several aquatic insects.

Vegetation Alliances

- *Eryngium castrense* (42.007.06) Coyote-thistle vernal pools (S2)*

Aquatic Resources

Wetlands are ecologically complex habitats that support a variety of plant and animal life. In a jurisdictional sense, the federal government defines wetlands in Section 404 of the Clean Water Act (CWA) as "areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support (and do support, under normal circumstances) a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 CFR 328.3[b] and 40 CFR 230.3). Under normal circumstances, the federal definition of wetlands requires three wetland identification parameters be present: wetland hydrology, hydric soils, and hydrophytic vegetation. The U.S. Army Corps of Engineers (USACE) is the agency responsible for regulating wetlands under Section 404 of the CWA, while the U.S Environmental Protection Agency (USEPA) has overall responsibility for the CWA. "Other waters of the U.S." refers to those hydric features that are regulated by the CWA but are not wetlands (33 CFR 328.4). Examples of other waters of the U.S. include rivers, creeks, intermittent channels, ponds, and lakes.

These features may also be regulated at the state level, including the Porter-Cologne Water Quality Control Act, the State Wetland Procedures, and California Fish and Game Code Section 1600 et seq.

An aquatic resources delineation was conducted for the project site by ESA in August 2019 and January 2021 (ESA, 2023). The aquatic resources delineation identified 7.585 acres of aquatic resources within the study area. Nearly all of the area is expected to be subject to regulation under either the CWA (2.828 acres) or state of California regulations (7.567 acres), or both. Aquatic resources within the project site are summarized in **Table 2.** All aquatic resources and extent of potentially jurisdictional boundaries identified in this report are considered preliminary pending verification from the appropriate regulatory agencies. It should be noted that the delineation study area is larger than the combination of offsite and project site areas.

Sensitive Natural Community

A sensitive natural community is a biological community that is regionally rare, provides important habitat opportunities for wildlife, is structurally complex, or is in other ways of special concern to local, state, or federal agencies. Most sensitive natural communities are given special consideration because they perform important ecological functions, such as maintaining water quality and providing essential habitat for plants and wildlife. Some plant communities support a unique or diverse assemblage of plant species and therefore are considered sensitive from a botanical standpoint. CEQA may identify the elimination of such communities as a significant impact.

Sensitive natural communities include: (a) areas of special concern to federal, state, or local resource agencies; (b) areas regulated under Section 404 of the CWA; and (c) areas regulated under the Porter-Cologne Water Quality Control Act.

The CDFW's *California Natural Community List* (CDFW, 2023d) ranks vegetation alliances in California according to their degree of rarity imperilment (as measured by rarity, trends, and threats). All alliances are listed with a G (global) and S (state) rank. Alliances with state ranks of S1-S3 are considered of special concern by the CDFW, and all associations within them are also considered to be highly imperiled. CDFW guidance recommends all alliances with state ranks of S1-S3 be considered and analyzed under CEQA. The following alliances found on the project site are considered sensitive natural communities:

- *Eryngium castrense* (42.007.06) Coyote-thistle vernal pools (S2)*
- *Salix gooddingii* (61.211.01) Goodding's willow thickets (S3)*

Wildlife Movement Corridors

Wildlife movement corridors are considered an important ecological resource by various agencies (CDFW and USFWS) and under CEQA. Movement corridors may provide favorable locations for wildlife to travel between different habitat areas such as foraging sites, breeding sites, cover areas, and preferred summer and winter range locations. They may also function as dispersal corridors allowing animals to move between various locations within their range. Topography and other natural factors, in combination with urbanization, can fragment or separate large open-space areas. Areas of human disturbance or urban development can fragment wildlife habitats and impede wildlife movement between areas of suitable habitat. This fragmentation creates isolated "islands" of vegetation that may not provide sufficient area to accommodate sustainable populations, and can adversely affect genetic and species diversity. Movement corridors mitigate the effects of this fragmentation by allowing animals to move between remaining habitats, which

in turn allows depleted populations to be replenished and promotes genetic exchange between separate populations.

The project site and surrounding area could potentially be used by a variety of wildlife species for dispersal and seasonal migration. However, there are no known wildlife movement corridors on the project site. The project site is not located in an "Important Biological Corridor" designated by the El Dorado County (2004) General Plan nor is it in important habitat for migratory deer herds (El Dorado County 2010).

Special-Status Species

Special-status species are regulated under the state and federal Endangered Species Acts or other regulations or are species that are considered sufficiently rare by the scientific community to qualify for such listing. Special-status species include:

- Species listed or proposed for listing as threatened or endangered under the federal Endangered Species Act (50 Code of Federal regulations [CFR] 17.12 [listed plants], 17.11 [listed animals] and various notices in the Federal Register [FR] [proposed species]);
- Species that are candidates for possible future listing as threatened or endangered under the federal Endangered Species Act (61 FR 40, February 28, 1996);
- Species listed or proposed for listing by the State of California as threatened or endangered under the California Endangered Species Act (14 California Code of Regulations [CCR] 670.5);
- Plants listed as rare or endangered under the California Native Plant Protection Act (California Fish and Game Code, Section 1900 et seq.);
- Animal species of special concern to CDFW;
- Animals fully protected under Fish and Game Code (California Fish and Game Code, Sections 3511 [birds], 4700 [mammals], and 5050 [reptiles and amphibians]);
- Species that meet the definitions of rare and endangered under CEQA. CEQA Section 15380 provides that a plant or animal species may be treated as "rare or endangered" even if not on one of the official lists (State CEQA Guidelines, Section 15380); and
- Plants considered by CNPS and CDFW to be "rare, threatened or endangered in California" (California Rare Plant Rank [CRPR] 1A, 1B, and 2 in CNPS, 2023) or that are included in El Dorado County Code §130.71.030.

A list of special-status species that have the potential to occur within the vicinity of the project site was compiled based on data contained in the CNDDB (CDFW, 2023), the USFWS list of federal endangered and threatened species that occur in or may be affected by the proposed project (USFWS, 2023a), and the CNPS Inventory of Rare and Endangered Plants (CNPS, 2023). A list of special-status species, their general habitat requirements, and an assessment of their potential to occur within and adjacent to the project site is provided below in **Table 3**.

The "Potential to Occur" categories are defined as follows:

- **Unlikely**: The project site and surrounding area does not support suitable habitat for a particular species and/or the project site is outside of the species known range;
- **Low Potential**: The project site and/or adjacent area provides only limited amounts and low quality habitat for a particular species. In addition, the known range for a particular species may be outside of the immediate project vicinity;
- **Medium Potential**: The project site and/or adjacent area provides suitable habitat for a particular species; and
- **High Potential**: The project site and/or adjacent area provide ideal habitat conditions for a particular species and/or known populations occur in the within the project site and adjacent area.

Conclusions regarding habitat suitability and species occurrence are based on the analysis of existing literature and databases described previously and known habitats occurring within the project site and regionally. Database queries identified 56 special-status plant and wildlife species records. Of these, 43 species were eliminated from further consideration based upon a lack of suitable habitat in the project site and/or the project site being outside the known range of the species. Twelve special-status species have medium or high potential to occur in the project site. Only species classified as having a medium or high potential for occurrence were considered in the impact analysis.

Critical Habitat

Critical habitat is defined in Section 3(5)A of the federal Endangered Species Act as the specific portions of the geographic area occupied by the species in which physical or biological features essential to the conservation of the species are found and that may require special management considerations or protection. Specific areas outside of the geographic area occupied by the species may also be included in critical habitat designations upon a determination that such areas are essential for the conservation of the species.

There is no critical habitat designated within or adjacent to the project site.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Amphibians			
California tiger salamander pop. 1 *Ambystoma californiense*	FT/ST	Grassland, oak savanna, and edges of mixed woodland and lower elevation coniferous forest. Requires temporary breeding ponds to breed. Spends most time underground in animal burrows, especially those of California ground squirrels, valley pocket gophers, and moles. Requires both suitable upland terrestrial habitat with mammal burrows for refuge and temporary breeding ponds in order to survive and reproduce. Found in the Central Valley and adjacent Sierra Nevada foothills up to 1,500 feet. The Cosumnes River marks the northern boundary of the species' range, with the exception of an isolated in the Dunnigan Hills in northern Yolo County.	**Unlikely.** Suitable habitat (seasonal wetlands, vernal pools, annual grassland) is present within the project site. However, the site is outside known species range; the project area is north of the Cosumnes River. There are no recorded observations of this species in the CNDDB within five miles.
Foothill yellow-legged frog pop. 5 *Rana boylii*	FE/SE	Partly shaded, shallow streams and riffles with a rocky substrate in a variety of habitats. Need at least some cobble-sized substrate for egg laying. Need at least 15 weeks to attain metamorphosis.	**Unlikely.** No suitable habitat is present for this species within the project site. There are no recorded observations of this species in the CNDDB within five miles.
California red-legged frog *Rana draytonii*	FT/SSC	Found mainly near ponds in humid forests, woodlands, grasslands, coastal scrub, and streamsides with plant cover. Most common in lowlands or foothills. Frequently found in woods adjacent to streams. Breeding habitat is in permanent or ephemeral water sources: lakes, ponds, reservoirs, slow streams, marshes, bogs, and swamps. Ephemeral wetland habitats require animal burrows or other moist refuges for estivation when the wetlands are dry. Found along the coast and coastal mountain ranges of California from Marin County to San Diego County and in the Sierra Nevada from Tehama County to Fresno County.	**Low.** The drainages within the project site provide marginal habitat for this species. There are no recorded observations of this species in the CNDDB within five miles.
Western spadefoot *Spea hammondii*	–/SSC	Occurs primarily in grassland habitats, but can be found in valley-foothill hardwood woodlands. Vernal pools (typically in large complexes) are essential for breeding and egg-laying. Found in the Sierra Nevada foothills, Central Valley, Coast Ranges, and coastal counties in southern California.	**Low.** Isolated marginal aquatic habitat (discontinuous seasonal wetlands, vernal pools) is sparse and broadly distributed across the project site. Suitable upland habitat (annual grasslands) is present within project site, but the low density of aquatic habitat reduces the likelihood for the species to occur. There are no recorded observations of this species in the CNDDB within five miles.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Birds			
Cooper's hawk *Accipiter cooperii*	MBTA/–	Typically found in woodlands, chiefly of open, interrupted or marginal type. Nest sites mainly in riparian growths of deciduous trees, as in canyon bottoms on river flood-plains and live oaks.	**Low.** Some suitable foraging habitat, but only marginal nesting habitat as there are no densely wooded areas or large open water habitats present in the project site. There are no recorded observations of this species in the CNDDB within five miles.
Tri-colored blackbird *Agelaius tricolor*	–/ST	Highly colonial, most numerous in Central Valley and vicinity. Nests in cattails, tules, and blackberries large enough for at least 50 nesting pairs, usually over water. Requires foraging area with insect prey within a few kilometers of the colony. Forages in grassland and cropland.	**High.** There is a nesting colony at the project site in riparian wetland blackberry patches associated with an intermittent channel. There are numerous occurrences documented in the CNDDB to the south and west within five miles.
Grasshopper sparrow *Ammodramus savannarum*	–/SSC	Occurs in dry, dense grasslands, especially with scattered shrubs for sitting perches. A thick cover of grasses and tall forbs is essential for concealment. Nests are built of grasses and forbs in slight depressions in ground hidden by a clump of grasses or forbs. Loosely colonial when nesting.	**Medium.** Grassland in the project site is kept grazed and relatively low in stature. There are relatively few shrubs present in the grassland. There are no recorded observations of this species in the CNDDB within five miles.
Golden eagle *Aquila chrysaetos*	–/FP	Cliffs and escarpments or tall trees for nesting; annual grasslands, chaparral, and oak woodlands with plentiful medium and large-sized mammals for prey. Foothills and mountains throughout California; uncommon nonbreeding visitor to lowlands such as the Central Valley.	**Low.** No nesting habitat is present within the project site. Could utilize annual grasslands for foraging. There are two recorded observations of this species in the CNDDB within five miles.
Great egret *Ardea alba* (nesting colony)	MBTA/--	Colonial nester in large trees. Rookery sites located near marshes, tide-flats, irrigated pastures, and margins of rivers and lakes.	**Unlikely.** No suitable rookery habitat is present for this species within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Great blue heron *Ardea herodias* (nesting colony)	MBTA/--	Colonial nester in tall trees, cliff sides, and sequestered spots on marshes. Rookery sites in close proximity to foraging areas: marshes, lake margins, tide-flats, rivers and streams, wet meadows.	**Unlikely.** No suitable nesting habitat is present for this species within the project site. There is one recorded observation of this species in the CNDDB within five miles.
Burrowing owl *Athene cunicularia*	--/SSC	Nests and forages in open, dry, annual or perennial grasslands and scrublands characterized by low-growing vegetation. Subterranean nester dependent upon burrowing mammals, especially California ground squirrel (*Otospermophilus beecheyi*) for burrows. May also be found around golf courses, and disturbed/ruderal habitat in urban areas. Forages in open plains, grasslands, and prairies.	**High.** Suitable nesting and foraging habitat occurs in annual grasslands in the project site. There are four recorded observations of this species in the CNDDB within five miles, and there is an additional recent observation immediately west in the Carson Creek Specific Plan Area.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Ferruginous hawk *Buteo regalis*	MBTA/--	Open grasslands, sagebrush flats, desert scrub, low foothills, and fringes of pinyon and juniper habitats. Breeding habitat includes features such as cliffs, outcrops, and tree groves for nesting. Eats mostly lagomorphs, ground squirrels, and mice. Population trends may follow lagomorph population cycles.	**Low.** Suitable foraging habitat is present but there is no nesting habitat for this species on the project site. There is one recorded observation of this species in the CNDDB within five miles.
Swainson's hawk *Buteo swainsoni*	–/ST	Breeds in grasslands with scattered trees, juniper-sage flats, riparian areas, savannahs, and agricultural or ranch lands with groves or lines of trees. Nests in oaks or cottonwoods in or near riparian habitats. Requires adjacent suitable foraging areas such as grasslands, alfalfa, or grain fields supporting rodent populations. Northern habitat summer range in California begins in central Tehama south to Kern County. Predominant breeding habitat is located in the Central Valley.	**Low.** No suitable nesting habitat is present on site; suitable foraging habitat is present within the annual grasslands. However, there are no recorded active nests within five miles of the project site. There are two recorded observations of this species in the CNDDB within five miles; however, both of these records are from 1992.
White-tailed kite *Elanus leucurus*	--/FP	Rolling foothills and valley margins with scattered oaks, and river bottomlands or marshes next to deciduous woodland. Open grasslands, meadows, or marshes for foraging close to isolated, dense-topped trees for nesting and perching.	**Medium.** Suitable nest trees are present within the blue oak grove on site. Annual grassland in the project area provides foraging habitat for this species. There are three recorded observations of this species in the CNDDB within five miles.
Merlin *Falco columbarius*	MBTA/–	Seacoast, tidal estuaries, open woodlands, savannahs, edges of grasslands, deserts, farms and ranches. Clumps of trees or windbreaks are required for roosting in open country. Species does not breed in California; breeds in Alaska and Canada. Uncommon winter migrant from September to May.	**Low.** Open areas of the project site provide marginal foraging habitat for this species. There are no recorded observations of this species in the CNDDB within five miles.
Bald eagle *Haliaeetus leucocephalus*	–/SE,FP	Prefers oceans shores, lake margins, and rivers for both nesting and wintering. Most nests are within one mile of water. Nests in large, old-growth, or dominant live tree with open branches, especially ponderosa pine. Roosts communally in winter.	**Unlikely.** Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.
California black rail *Laterallus jamaicensis*	--/ST,FP	Found in salt, brackish, and freshwater marsh with dense vegetation for nesting habitat. Majority of population found in the tidal salt marshes of the northern San Francisco Bay region, primarily in San Pablo and Suisun Bays; also found in freshwater marshes in the foothills of the Sierra Nevada.	**Unlikely.** Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.
Double-crested cormorant *Nannopterum auritum*	MBTA/–	Colonial nester on coastal cliffs, offshore islands, and along lake margins in the interior of the state. Nests along coast on sequestered islets, usually on ground with sloping surface, or in tall trees along lake margins.	**Unlikely.** Suitable nesting habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Bank swallow *Riparia riparia*	--/ST	Colonial nester; nests primarily in riparian and other lowland habitats west of the desert. Requires vertical banks/cliffs with fine-textured/sandy soils near streams, rivers, lakes, and ocean to dig nesting hole.	**Unlikely**. Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Fish			
Delta smelt *Hypomesus transpacificus*	FT/SE	Open surface waters in the Sacramento/San Joaquin Delta. Seasonally in Suisun Bay, Carquinez Strait and San Pablo Bay. Found in Delta estuaries with dense aquatic vegetation and low occurrence of predators. May be affected by downstream sedimentation.	**Unlikely**. Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Steelhead – Central Valley DPS *Oncorhynchus mykiss irideus* pop. 11	FT/--	This evolutionary significant unit (ESU) enters the Sacramento and San Joaquin Rivers and their tributaries from July to May; spawning occurs from December to April. Young move to rearing areas in and through the Sacramento and San Joaquin Rivers, Delta, and San Pablo and San Francisco Bays. Needs cool water with moderate size gravel for spawning and cover for rearing.	**Unlikely**. Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Invertebrates			
Vernal pool fairy shrimp *Branchinecta lynchi*	FT/--	Endemic to the grasslands of the Central Valley, central coast mountains, and south coast mountains, in astatic rain-filled pools. Inhabit small, clear-water sandstone-depression pools and grassed swale, earth slump, or basalt-flow depression pools.	**Medium.** The seasonal wetlands and vernal pools within the project site provide suitable habitat for this species. There are three recorded observations of this species in the CNDDB within five miles.
Crotch bumble bee *Bombus crotchii*	--/SCE	Inhabits grassland and scrub areas, requiring a hotter and drier environment than other bumblebee species and nests underground, often in abandoned rodent dens. The historic range includes much of southern California, the San Joaquin Valley, central coast range, Bay Area, and more limited areas elsewhere in northern California (The Xerces Society 2018).	**Unlikely**. The grassland may provide suitable habitat, but the site is outside the current range and there are no records in El Dorado County despite a relatively high sampling effort (The Xerces Society 2018). There are no recorded observations of this species in the CNDDB within five miles
Monarch butterfly *Danaus plexippus*	FC/--	Overwintering trees occur near the coast. Larvae feed on milkweed plants (*Asclepias* sp.) elsewhere.	**Low.** Narrow leaf milkweed plants were observed on the project site, but in low abundance. The project site provides limited habitat but is outside of known winter aggregation sites.
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	FT/--	Occurs only in the Central Valley of California, in association with blue elderberry (*Sambucus nigra* subsp. *caerulea*). Prefers to lay eggs in elderberries 2-8 inches in diameter; some preference shown for "stressed" elderberries.	**Unlikely.** No suitable habitat is present for this species within the project area. No elderberry shrubs were noted within the site during biological surveys conducted for the project. There are no recorded observations of this species in the CNDDB within five miles.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Vernal pool tadpole shrimp *Lepidurus packardi*	FE/--	Inhabits vernal pools and swales in the Sacramento Valley containing clear to highly turbid water. Pools commonly found in grass bottomed swales of unplowed grasslands. Some pools are mud-bottomed and highly turbid.	**Medium.** The seasonal wetlands and vernal pools within the project site suitable marginal habitat for this species. There are five recorded observations of this species in the CNDDB within five miles.
Mammals			
Pallid bat *Antrozous pallidus*	--/SSC	Deserts, grasslands, shrublands, woodlands, and forests. Most common in open, dry habitats with rocky outcroppings for roosting, particularly near water. Roosts in rock crevices, buildings, and under bridges. Roosts must protect bats from high temperatures. Very sensitive to disturbance of roosting sites.	**Low.** No suitable roosting habitat is present in the project site; however, suitable foraging habitat is present in the annual grasslands. There are no recorded observations of this species in the CNDDB within five miles.
Fisher – West Coast DPS *Pekania pennanti*	--/SSC	Intermediate to large-tree stages of coniferous forests and deciduous-riparian areas with high canopy closure. Uses cavities, snags, logs, and rocky areas for cover and denning. Needs large areas of mature, dense forest.	**Unlikely**. Suitable habitat is not present within the project site.
American badger *Taxidea taxus*	--/SSC	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats, with friable soils. Needs sufficient food, friable soils, and open, uncultivated ground. Preys on burrowing rodents. Digs burrows.	**Low.** Suitable burrowing and foraging habitat occurs in annual grasslands in the project site; however, no burrows that could be utilized by this species were present. There are no recorded observations of this species in the CNDDB within five miles.
Reptiles			
Western pond turtle *Emys marmorata*	FPT/SSC	A thoroughly aquatic turtle of ponds, marshes, rivers, streams, and irrigation ditches, usually with aquatic vegetation, below 6,000 feet elevation. Need basking sites and suitable (sandy banks or grassy open fields) upland habitat up to 0.5 kilometer from water for egg-laying. Populations extend throughout the coast and Central Valley of CA.	**Medium**. Suitable habitat is present in the intermittent stream and nesting habitat is present in adjacent uplands within the project site. There are four recorded observations of this species in the CNDDB within five miles.
Coast horned lizard *Phrynosoma blainvillii*	--/SSC	Frequents a wide variety of habitats; however, most common in lowlands along sandy washes with scattered low bushes. Inhabits open areas of sandy soil and low vegetation in valleys, foothills and semiarid mountains. Found in grasslands, coniferous forests, woodlands, and chaparral, with open areas and patches of loose soil. Needs open areas for sunning, bushes for cover, patches of loose soil for burial, and abundant supply of native ants.	**Unlikely**. Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Giant gartersnake *Thamnophis gigas*	FT/ST	Prefers freshwater marsh and low gradient streams. Has adapted to sloughs, canals, and other small water-ways where there is a prey base of small fish and amphibians. Requires grassy banks and emergent vegetation for basking and areas of high ground protected from flooding during winter. Utilizes upland habitats within 200 feet from aquatic habitats. This is the most aquatic of the garter snakes in California. Occurs in the Central Valley from Fresno County north to the Gridley/Sutter Buttes area; has been extirpated from areas south of Fresno.	**Unlikely.** Suitable habitat is not present within the project site. The project site is outside the range. There are no recorded observations of this species in the CNDDB within five miles.
Plants			
Jepson's onion *Allium jepsonii*	–/–/1B.2	Open, serpentine or volcanic slopes, flats. Blooms April- August. Elevation 300-600m.	**Unlikely.** Suitable habitat is not present within the project site. Site is outside elevation range of species. There are no recorded observations of this species in the CNDDB within five miles.
Ione manzanita *Arctostaphylos myrtifolia*	FT/--/1B.2	Acidic sandy or clay soils, chaparral, woodland. Blooms January – February. Elevation 70-770m.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Stebbin's morning-glory *Calystegia stebbinsii*	FE/SE/1B.1	Chaparral. Blooms April – June. Elevation 185-1,090m.	**Unlikely.** Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.
Chaparral sedge *Carex xerophila*	--/--/1B.2	Dry gabbro or serpentine soils in open forest, scrub, thicket edges, chaparral. Fruits March -- June. Elevation 450-770m.	**Unlikely.** Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.
Pine Hill ceanothus *Ceanothus roderickii*	FE/SR/1B.1	Rocky, gabbro-derived substrates, chaparral, oak/pine woodland. Blooms March – June. Elevation 260-630m.	**Unlikely.** Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.
Red Hills soaproot *Chlorogalum grandiflorum*	–/–/1B.2	Serpentine or gabbro outcrops, open shrubby or wooded hills. Blooms May – June. Elevation 300-500m.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Bisbee Peak rush rose *Crocanthemum suffrutescens*	--/--/3.2	Shallow soils on Ione formations within in chaparral. Blooms April – June. Elevation 100-700m.	**Unlikely.** Suitable habitat is not present within the project site. There are three recorded observations of this species in the CNDDB within five miles.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	**Listing Status USFWS/ CDFW/CNPS**	**General Habitat Requirements**	**Potential for Species Occurrence at the Project Site**
Dwarf downingia *Downingia pusilla*	--/--/2B.2	Vernal pools, roadside ditches. Blooms March – May. Elevation up to 150m.	**Medium.** Suitable habitat present in the vernal pools and some seasonal wetlands present in the project site. There are no recorded observations of this species in the CNDDB within five miles.
Starved daisy *Erigeron miser*	--/--/1B.3	Rocky sites. Blooms July – October. Elevation 1,900-2,300m.	**Unlikely.** Suitable habitat is not present within the project site. Site is outside elevation range of species. There is one recorded observation of this species in the CNDDB within five miles.
Ione buckwheat *Eriogonum apricum* var. *apricum*	FE/SE/1B.1	Clay soils on Ione formations. Blooms June – October. Elevation 80-200m.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Irish Hill buckwheat *Eriogonum apricum* var. *prostratum*	FE/SE/1B.1	Clay soils on Ione formations. Blooms June – July. Elevation 90-120m.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Tuolumne button-celery *Eryngium pinnatisectum*	--/--/1B.2	Vernal pools, swales, intermittent streams. Blooms May – August. Elevation 70-950m.	**Medium.** Suitable habitat present in the vernal pools, seasonal wetlands, swales and intermittent streams present in the project site. There are no recorded observations of this species in the CNDDB within five miles.
Pine Hill flannelbush *Fremontodendron decumbens*	FE/SR/1B.2	Gabbro outcrops in chaparral or pine woodland. Blooms April – July. Elevation 425-7 60m.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
El Dorado bedstraw *Galium californicum* subsp. *sierrae*	FE/SR/1B.2	Oak pine, oak forests, chaparral. Blooms March – July. Elevation 100-500m.	**Unlikely.** Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.
Boggs Lake hedge-hyssop *Gratiola heterosepala*	--/SE/1B.2	Shallow water, margins of vernal pools. Blooms April – September. Elevation up to 1,600m.	**Medium.** Suitable habitat present in the vernal pools and some seasonal wetlands present in the project site. There is one recorded observation of this species in the CNDDB within five miles.
Parry's horkelia *Horkelia parryi*	--/--/1B.2	Chaparral or woodland. Blooms April – September. Elevation 80-1,070m.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Ahart's dwarf rush *Juncus leiospermus* var. *ahartii*	--/--/1B.2	Vernal pool margins, grassland swales, and gopher mounds. Fruits March – May. Elevation 30-90m.	**Medium.** Suitable habitat present in the vernal pools, seasonal wetlands, and swales present in the project site. There are no recorded observations of this species in the CNDDB within five miles.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Legenere *Legenere limosa*	–/–/1B.1	Wet areas, vernal pools, ponds. Blooms March – June. Elevation up to 950m.	**Medium.** Suitable habitat present in the vernal pools and some seasonal wetlands present in the project site. There is one recorded observation of this species in the CNDDB within five miles.
Pincushion navarretia *Navarretia myersii* subsp. *myersii*	–/–/1B.1	Vernal pools. Blooms April – May. Elevation 20-90m.	**Medium.** Suitable habitat present in the vernal pools and some seasonal wetlands present in the project site. There are no recorded observations of this species in the CNDDB within five miles.
Slender Orcutt grass *Orcuttia tenuis*	FT/SE/1B.1	Vernal pools, often gravelly soils. Species requires prolonged inundation period. Species known from larger pools (>0.2 acre). Blooms May – October. Elevation 36-1,760m.	**Unlikely.** Although the project site supports vernal pool habitat, the vernal pools in the site are not large enough nor do they remain inundated long enough to support this species. There are no recorded observations of this species in the CNDDB within five miles.
Sacramento Orcutt grass *Orcuttia viscida*	FE/SE/1B.1	Vernal pools. Species requires prolonged inundation period. Species known from larger pools (>0.1 acre). Blooms April – July. Elevation up to 100m.	**Unlikely.** Although the project site supports vernal pool habitat, the vernal pools in the site are not large enough nor do they remain inundated long enough to support this species. There are no recorded observations of this species in the CNDDB within five miles.
Layne's ragwort *Packera layneae*	FT/SR/1B.2	Serpentine or gabbroic soils within openings in chaparral or woodlands. Blooms April – August. Elevation 200-1,085m.	**Unlikely.** Suitable habitat is not present within the project site. There are three recorded observations of this species in the CNDDB within five miles.
Sanford's arrowhead *Sagittaria sanfordii*	–/–/1B.2	Ponds, ditches. Blooms May – November. Elevation up to 300m.	**Low.** Most of the aquatic habitats do not inundate long enough to support this species. There is limited habitat in some of the aquatic habitats that receive warm-season irrigation runoff from nearby development. There is one recorded observation of this species in the CNDDB within five miles, but most records are in the Central Valley and not the foothills.
El Dorado County mule ears *Wyethia reticulata*	–/–/1B.2	Wooded slopes, chaparral, coniferous forest, clay or gabbroic soils. Blooms April – August. Elevation 150-630m.	**Unlikely.** Suitable habitat is not present within the project site. There are two recorded observations of this species in the CNDDB within five miles.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site

STATUS CODES:

FEDERAL (U.S. Fish and Wildlife Service):

FE = Listed as Endangered by the Federal Government
FT = Listed as Threatened by the Federal Government
FPT = Federally proposed as Threatened
FC = Candidate for Federal Listing
MBTA = Migratory Bird Treaty Act (used when other designations absent)

STATE (California Department of Fish and Wildlife):

SE = Listed as Endangered by the State of California
ST = Listed as Threatened by the State of California
SCE = Candidate for state Listing
SSC = California species of special concern
CFP = California fully protected bird species

California Native Plant Society (CNPS):

Rank 1A = Plants presumed extirpated in California and either rare or extinct elsewhere
Rank 1B = Plants rare, threatened, or endangered in California and elsewhere
Rank 2A = Plants presumed extirpated in California but common elsewhere
Rank 2B = Plants rare, threatened, or endangered in California but more common elsewhere
Rank 3 = Plants about which more information is needed
Rank 4 = Plants of limited distribution

CNPS Code Extensions

.1 = Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
.2 = Fairly threatened in California (20-80% occurrences threatened)
.3 = Not very threatened in California (less than 20% of occurrences threatened or no current threats known)

SOURCE: CDFW, 2023a; USFWS, 2023a; CNPS, 2023

Regulatory Framework

This subsection briefly describes federal, state, and local regulations, permits, and policies pertaining to biological resources as they apply to the proposed project. The project proponent would be required to abide by all applicable regulations and permit requirements in effect at the time of construction.

Federal

Federal Endangered Species Act

The federal Endangered Species Act (FESA) protects candidate, threatened, and endangered plants and animals and their critical habitat. Candidate species are those proposed for listing; these species are usually treated by resource agencies as if they were actually listed during the environmental review process. Procedures for addressing impacts to federally listed species follow two principal pathways, both of which require consultation with the USFWS, which administers the FESA for all terrestrial species. The first pathway, Section 10(a) incidental take permit, applies to situations where a non-federal government entity must resolve potential adverse impacts to species protected under the FESA. The second pathway, Section 7 consultation, applies to projects directly undertaken by a federal agency or private projects requiring a federal permit or approval.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) enacts the provisions of treaties between the U.S., Great Britain, Mexico, Japan, and the Soviet Union and authorizes the U.S. Secretary of the Interior to protect and regulate the taking of migratory birds. It establishes seasons and bag limits for hunted species and protects migratory birds, their occupied nests, and their eggs. Most actions that result in take or in permanent or temporary possession of a protected species constitute violations of the MBTA. Examples of permitted actions that do not violate the MBTA are the possession of a hunting license to pursue specific game birds, legitimate research activities, display in zoological gardens, bird banding, and other similar activities. USFWS is responsible for overseeing compliance with the MBTA.

Clean Water Act

The federal Clean Water Act (CWA) was enacted as an amendment to the federal Water Pollution Control Act of 1972, which outlined the basic structure for regulating discharges of pollutants to waters of the U.S. The CWA serves as the primary federal law protecting the quality of the nation's surface waters, including lakes, rivers, and coastal wetlands.

Section 404

CWA Section 404 regulates the discharge of dredged and fill materials into waters of the U.S. Waters of the U.S. refers to oceans, bays, rivers, streams, lakes, ponds, and wetlands. Applicants must obtain a permit from the U.S. Army Corps of Engineers (USACE) for all discharges of dredged or fill material into waters of the U.S., including wetlands, before proceeding with a proposed activity. Waters of the U.S. are under the jurisdiction of the USACE and the USEPA.

Compliance with CWA Section 404 requires compliance with several other environmental laws and regulations. The USACE cannot issue an individual permit or verify the use of a general nationwide permit until the requirements of FESA and the National Historic Preservation Act have been met. In addition, the USACE cannot issue or verify any permit until a water quality certification or a waiver of certification has been issued pursuant to CWA Section 401.

Section 401

Under CWA Section 401, applicants for a federal license or permit to conduct activities which may result in the discharge of a pollutant into waters of the U.S. must obtain certification from the state in which the discharge would originate or, if appropriate, from the interstate water pollution control agency with jurisdiction over affected waters at the point where the discharge would originate. Therefore, all projects that have a federal component and may affect state water quality (including projects that require federal agency approval, such as issuance of a Section 404 permit) must also comply with CWA Section 401.

State

Porter-Cologne Water Quality Control Act

The State Water Resources Control Board and the Regional Water Quality Control Boards (RWQCBs) (together "Boards") are the principal state agencies with primary responsibility for the coordination and control of water quality. In the Porter-Cologne Water Quality Control Act

(Porter-Cologne), the Legislature declared that the "state must be prepared to exercise its full power and jurisdiction to protect the quality of the waters in the state from degradation..." (California Water Code section 13000).

Porter-Cologne grants the Boards the authority to implement and enforce the water quality laws, regulations, policies and plans to protect the groundwater and surface waters of the state. Waters of the state determined to be jurisdictional would require, if impacted, waste discharge permitting and/or a CWA Section 401 certification (in the case of a required USACE permit under Section 404). The enforcement of the state's water quality requirements is not solely the purview of the Boards and their staff. Other agencies (e.g., the CDFW under Section 5650 of the California Fish and Game Code) have the authority to enforce certain water quality provisions in state law.

State Wetland Dredge and Fill Policy

The State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (procedures), as prepared by the State Water Resources Control Board, was implemented on May 28, 2020. The procedures include a definition for wetland waters of the state that include (1) all wetland waters of the United States; and (2) aquatic resources that meet both the soils and hydrology criteria for wetland waters of the United States but lack vegetation.[2]

California Endangered Species Act

Under the California Endangered Species Act (CESA), CDFW has the responsibility for maintaining a list of endangered and threatened species.[3] Sections 2050 through 2098 of the California Fish and Game Code outline the protection provided to California's rare, endangered, and threatened species. Section 2080 of the California Fish and Game Code prohibits the taking of plants and animals listed under the CESA. Section 2081 established an incidental take permit program for state-listed species. CDFW maintains a list of "candidate species" which are species that CDFW formally notices as being under review for addition to the list of endangered or threatened species.

Pursuant to the requirements of CESA, an agency reviewing a proposed project within its jurisdiction must determine whether any state-listed endangered or threatened species may be present in the project site and determine whether the proposed project would have a potentially significant impact on such species. In addition, CDFW encourages informal consultation on any proposed project that may impact a candidate species.

Project-related impacts to species on the CESA endangered or threatened list would be considered significant. Under Section 86 of the California Fish and Game Code "take" is defined as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill". "Take" of protected species incidental to otherwise lawful management activities may be authorized under California Fish and Game Code Section 206.591. Authorization from CDFW would be in the form of an Incidental Take Permit.

2 Less than 5 percent areal coverage at the peak of the growing season.

3 Section 2070 of the California Fish and Game Code.

California Fish and Game Code

Fully Protected Species

Certain species are considered *fully protected*, meaning that the code explicitly prohibits all take of individuals of these species except for take permitted for scientific research. Section 5050 lists fully protected amphibians and reptiles, Section 5515 lists fully protected fish, Section 3511 lists fully protected birds, and Section 4700 lists fully protected mammals.

It is possible for a species to be protected under California Fish and Game Code, but not fully protected. For instance, mountain lion (*Puma concolor*) is protected under Section 4800, et seq., but is not a fully protected species.

Protection of Birds and Their Nests

Under Section 3503 of the California Fish and Game Code, it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by the code or any regulation made pursuant thereto. Section 3503.5 of the California Fish and Game Code prohibits take, possession, or destruction of any birds in the orders Falconiformes (hawks) or Strigiformes (owls), or of their nests and eggs. Migratory non-game birds are protected under Section 3800, while other specified birds are protected under California Fish and Game Code Section 3505.

Stream and Lake Protection

CDFW has regulatory authority over streams and lakes and the wetland resources associated with these aquatic systems under California Fish and Game Code Sections 1600, et seq. through administration of lake or streambed alteration agreements. Under Sections 1600, et seq., of the California Fish and Game Code, CDFW has the authority to regulate work that will "substantially divert or obstruct the natural flow of, or substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake, or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river lake or stream." CDFW enters into a lake or streambed alteration agreement with the project proponent and can impose conditions in the agreement to minimize and mitigate impacts to fish and wildlife resources. Because CDFW includes under its regulatory authority streamside habitats that may not qualify as wetlands under the federal CWA definition, CDFW regulatory authority may be broader than USACE or water board jurisdiction.

Pursuant to the California Fish and Game Code, a project proponent must submit a notification of lake or streambed alteration to CDFW before construction. The notification requires an application fee for a lake or streambed alteration agreement, with a specific fee schedule to be determined by CDFW. CDFW can enter into programmatic agreements that cover recurring operation and maintenance activities and regional plans. These agreements are sometimes referred to as Master Streambed Alteration Agreements (MSAAs).

Native Plant Protection Act

State listing of plant species began in 1977 with the passage of the California Native Plant Protection Act (NPPA), which directed the CDFW to carry out the legislature's intent to "preserve, protect, and enhance endangered plants in this state." The NPPA gave the California Fish and Game Commission the power to designate native plants as endangered or rare and to

require permits for collecting, transporting, or selling such plants. CESA expanded on the original NPPA and enhanced legal protection for plants. CESA established threatened and endangered species categories, and grandfathered all rare animals—but not rare plants—into the act as threatened species. Thus, three listing categories for plants are employed in California: rare, threatened, and endangered.

California Rare Plant Ranking System

CDFW works in collaboration with the CNPS to maintain a list of plant species native to California that have low numbers, limited distribution, or are otherwise threatened with extinction. These species are categorized by rarity in the California Rare Plant Ranking (CRPR) system. This information is published in the Inventory of Rare and Endangered Vascular Plants of California. Potential impacts to populations of CRPR species may receive consideration under CEQA review. The following identifies the definitions of the CRPR:

Rank 1A: Plants presumed extirpated in California and either rare or extinct elsewhere.

Rank 1B: Plants Rare, Threatened, or Endangered in California and elsewhere.

Rank 2A: Plants presumed extirpated in California, but more common elsewhere.

Rank 2B: Plants Rare, Threatened, or Endangered in California, but more common elsewhere.

Rank 3: Plants about which more information is needed - A Review List.

Rank 4: Plants of limited distribution - A Watch List.

Local

El Dorado County General Plan

Biological resources are addressed in the El Dorado County General Plan Conservation and Open Space Element. Applicable policies from the El Dorado County General Plan are listed below.

Conservation and Open Space Element

Policy 7.3.3.1: For projects that would result in the discharge of material to or that may affect the function and value of river, stream, lake, pond, or wetland features, the application shall include a delineation of all such features. For wetlands, the delineation shall be conducted using the U.S. Army Corps of Engineers (USACE) Wetland Delineation Manual.

Policy 7.3.3.5: Rivers, streams, lakes and ponds, and wetlands shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site while disturbance to the resource is avoided or minimized and fragmentation is limited.

Policy 7.3.4.1: Natural watercourses shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site without disturbance.

Policy 7.3.4.2: Modification of natural stream beds and flow shall be regulated to ensure that adequate mitigation measures are utilized.

Policy 7.4.2.1: The County will coordinate wildlife and vegetation protection programs with appropriate Federal and State agencies.

Policy 7.4.2.2: The County shall continue to support the Noxious Weed Management Group in its efforts to reduce and eliminate noxious weed infestations to protect native habitats and to reduce fire hazards.

Policy 7.4.2.4: Protect and preserve wildlife habitat corridors within public parks and natural resource protection areas to allow for wildlife use. Recreational uses within these areas shall be limited to those activities that do not require grading or vegetation removal.

Policy 7.4.2.5: Setbacks from all rivers, streams, and lakes shall be included in the Zoning Ordinance for all ministerial and discretionary development projects.

Policy 7.4.2.8: Conserve contiguous blocks of important habitat to offset the effects of increased habitat loss and fragmentation elsewhere in the County through a Biological Resource Mitigation Program (Program).

Policy 7.4.4.2: Through the review of discretionary projects, the County, consistent with any limitations imposed by State law, shall encourage the conservation protection, planting, restoration, and regeneration of native trees in new developments and within existing communities.

Policy 7.4.4.4: For all new development projects or actions that result in impacts to oak woodlands and/or individual native oak trees, including Heritage Trees, the County shall require mitigation as outlined in the El Dorado County Oak Resources Management Plan (ORMP). The ORMP functions as the oak resources component of the County's biological resources mitigation program, identified in Policy 7.4.2.8.

Impacts and Mitigation Measures

Significance Criteria

The project would result in a significant impact on the environment if it would:

a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service;

b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service;

c. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;

e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; or

f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

Impact Assessment Methodology

This section assesses the potential for the project to adversely change biological resources within the project site or in the adjacent area. The impact analysis focuses on foreseeable changes to the baseline condition and compares those changes to the significance criteria. Potential impacts are analyzed using information presented above regarding habitats present in the project site or adjacent area, and the potential occurrence of special-status species.

In the impact analysis, three principal factors were considered: (1) magnitude of the impact (e.g., substantial/not substantial); (2) uniqueness of the affected resource (i.e., rarity of the resource); and (3) susceptibility of the affected resource to perturbation (i.e., sensitivity of the resource). The evaluation of the significance considered the interrelationship of these three factors. For example, a relatively small magnitude impact to a state or federally listed species would be considered significant if the species is exceptionally rare or believed to be highly susceptible to disturbance. Conversely, a plant community such as annual grassland is not necessarily rare or sensitive to disturbance. Therefore, a much larger magnitude of impact would be necessary to result in a significant impact.

Impact Analysis

Habitat impacts are identified in **Table 4** and **Figure 4**. All of the offsite impacts will be in Latrobe Road or adjacent developed/disturbed areas, and those acreage impacts are not included.

TABLE 4
HABITAT IMPACTS

Habitat Type	Area (acres)
Annual Grassland	180.83
Blue Oak Woodland	0.20
Culvert	<0.01
Developed/Disturbed	0.54
Ephemeral Drainage (Riverine)	1.19
Intermittent Drainage (Riverine)	0.64
Seasonal Wetland*	2.01
Valley Foothill Riparian	0.11
Vernal Pool	0.07
Total Impacts	**188.59**

* Seasonal wetland includes seeps, riverine seasonal wetland, seasonal wetland, and wetland swale features.
Totals may not sum due to rounding.

Figure 4
Habitat with Project Impact Areas

Impact Discussion

a) **Would the project have a substantial adverse effect, either directly or through habitat modification, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of fish and Wildlife or U.S. Fish and Wildlife Service?**

Less than Significant with Mitigation Incorporated. Special-status species and their habitats that may be affected either directly or indirectly through implementation of the proposed project are vernal pool fairy and tadpole shrimp, special-status birds, nesting raptors and migratory birds, western pond turtle, and special-status plant species. Each of these potentially affected species is described below.

Vernal Pool Fairy Shrimp and Vernal Pool Tadpole Shrimp

Vernal pools and some seasonal wetlands in the project site provide suitable habitat for the federally listed vernal pool fairy shrimp and vernal pool tadpole shrimp. Most of the waters and wetlands on the project site are not habitat for listed branchiopods because they are either riverine, flow-through channels, or they are sloped wetlands that do not pond water. Based on a field visit on December 10, 2020 the following features on the project site provide potential habitat for listed branchiopods:

- Vernal Pools (VP) 3 (0.012 acre) and 4 (0.038 acre) are naturally occurring vernal pools. VP 3 has been slightly altered by an adjacent bladed firebreak, but retains natural hydrology. There has been no disturbance to VP 4 or its small watershed. Both of these features were dry during the field visit.
- Vernal pool 5 (0.006 acre) may be naturally occurring, but its hydrology has been substantially altered. VP 5 is next to a drainage that receives runoff from a subdivision on the east side of Latrobe Road. Most of the homes in the subdivision have been built in the last six years. The drainage was flowing during the field visit, when other drainages at the site without developed watersheds were dry. VP 5 was full as a result of runoff from the adjacent drainage. VP 5 still appears to dry in the summertime based on vegetation and aerial photography and could still provide habitat for listed branchiopods.
- Vernal pool 1 (0.007 acre) and seasonal wetland (SW) 2 (0.062 acre) are deeper areas of naturally occurring swales. They are both along the western boundary of the site. A bladed firebreak has pushed soil across the swales, causing water to inundate during the wet season. VP 1 does not receive artificial runoff. SW 2 may receive some artificial runoff from nearby developed areas. Both features were dry during the field visit.

Together these five features comprise approximately 0.125 acre. USFWS would likely concur that these features are potential habitat for listed branchiopods. Other small seasonal wetlands, and one vernal pool (VP-2), were determined based on topography and vegetation to be too infrequently, if ever, inundated to support listed branchiopods. However, USFWS could also determine that some or all of these other wetlands are also potential habitat.

The project will result in impacts to habitat potentially occupied by vernal pool fairy and tadpole shrimp. Project grading will result in the loss of three features (VP 1-4), comprising 0.065 acre, that provide potential habitat.

USFWS considers potential impacts that may occur to vernal pool fairy and tadpole shrimp as a result of work within 250 feet of potential occupied habitat (USFWS, 1996). There is no potential occupied habitat within 250 feet of project grading based on field visits and a review of aerial photography.

The loss of 0.065 acre of potentially occupied habitat would be considered a **potentially significant** impact. With the implementation of **Mitigation Measures BIO-1** and **BIO-4** through **BIO-7**, the project's impact to vernal pool fairy shrimp and vernal pool tadpole shrimp would be considered **less than significant**.

Special-Status Birds and Common Nesting Migratory Birds and Raptors

The project site and adjacent areas provide suitable habitats for nesting birds, including, but not limited to, special-status species such as tri-colored blackbird, grasshopper sparrow, burrowing owl, and white-tailed kite, as well as more common migratory birds and raptors.

Tri-colored Blackbird

Tri-colored blackbirds nest in colonies of hundreds to tens of thousands of individuals. Nesting colonies will often occur in the same location over many years, but colonies may also shift locations if nest failure occurs. There is a CNDDB record of a tri-colored blackbird nesting colony at the project site (CNDDB Occurrence #1012). This occurrence is associated with an intermittent channel and supports dense thickets of Himalayan blackberry and a few willows, which provide suitable habitat to support this colony. This colony was first documented in 2005 and totaled approximately 200 individuals. Approximately 1,200 to 5,000 individuals were noted in 2014, and approximately 1,900 individuals were observed in 2015, the last year for which information appears in CNDDB (CDFW, 2023a).

ESA conducted a site visit on April 19, 2022 to determine the current status of the tri-colored blackbird nesting colony. The results memo is in **Appendix B**. The nesting colony reported in CNDDB was observed in clusters of Himalayan blackberry in riparian wetlands during the survey. The blackberry shrubs are in the northwest corner of the project site. The colony is located approximately 400 feet from existing development. Tri-colored blackbirds were heard vocalizing and the distinct white band under the red shoulder was observed on several individuals of male blackbirds (this characteristic is only evident on males) in the colony. Several grass cup nests were observed in the blackberry shrubs and, combined with the presence of males vocalizing, confirmed tri-colored blackbird nesting activity. Tri-colored blackbirds exhibiting potential breeding behavior were watched for approximately 45 minutes. While individual nests were observed, the presence of eggs or young could not be confirmed. Due to the concurrent presence of numerous red-winged blackbirds (*Agelaius phoeniceus*), the similarity of

both species' nests, and the tangled nature of the blackberry nesting substrate, the approximate number of tri-colored blackbird nests could not accurately be estimated.

Project grading will result in the removal of approximately 0.06 acre of tri-colored blackbird nesting habitat (Riparian Wetland [RW] 11). In other portions of the colony the limits of grading will be approximately 15 to 100 feet away. Human disturbances and noise from construction activities have the potential to cause colony abandonment and death of young or loss of reproductive success during nesting season. Nesting birds could be adversely affected if the colony is exposed to a substantial increase in noise or human presence during project construction. This would be considered a **potentially significant** impact. With the implementation of **Mitigation Measures BIO-2a, BIO-4,** and **BIO-6,** the project's impact to tricolored blackbird would be considered **less than significant**.

Tri-colored blackbird is threatened under the California Endangered Species Act (CESA). In the event that an incidental take permit is required under CESA, CDFW may require additional mitigation. CESA requires impacts to be "fully mitigated" (CA Fish and Game Code §2081(b)(2)), a threshold higher than CEQA requirements.

Burrowing Owl and Grasshopper Sparrow

Suitable annual grassland habitat for these species is present within the project site; however, no burrowing owls or grasshopper sparrows or active nests were observed during the biological surveys. Some soils within the project site are sandy and friable, which could provide suitable burrowing sites. While no soil mounds were visible during the field survey, surrounding fence posts would provide suitable perches above potential nests within the annual grassland habitat. The annual grassland habitat also provides suitable foraging habitat for these species.

Accordingly, the proposed project could potentially impact individual burrowing owls or grasshopper sparrows if they occupied the project site prior to construction. Indirect impacts to nesting birds during construction could extend up to 500 feet from the limits of construction. Potential impacts could include abandonment of nest sites and the mortality of young. This would be considered a **potentially significant** impact. With the implementation of **Mitigation Measures BIO-2a, BIO-2b, BIO-5,** and **BIO-6,** the project's impact to burrowing owl and grasshopper sparrow would be considered **less than significant**.

The proposed project could also result in a permanent loss of foraging opportunities for these species in the project site. The loss of foraging habitat in the project site is not expected to significantly impact these species because these habitats are abundant in the vicinity.

Other Nesting Migratory Birds and Raptors

Suitable nest trees for white-tailed kite are located within and adjacent to the project site, and the annual grasslands provide suitable foraging habitat for this species. Habitat features

within the project site and adjacent areas, such as trees, shrubs, and herbaceous plants, could serve as nesting habitats or foraging areas for common migratory birds and raptors.

Construction of the project would result in the removal of vegetation which may serve as perching or nesting sites for special-status species and more common migratory birds and raptors. Direct impacts on special-status birds, nesting raptors, or migratory birds or their habitat could result in substantial lowered reproductive success or habitat loss, thereby potentially adversely affecting local population levels. Additionally, human disturbances and noise from construction activities have the potential to cause nest abandonment and death of young or loss of reproductive success at active nests located near project activities. Birds could be adversely affected if active nesting, roosting, or foraging sites are either removed or exposed to a substantial increase in noise or human presence during Project activities. Nesting birds and raptors are protected under California Fish and Game Code Section 2080 (i.e., killing of a listed species), Sections 3503, 3503.5, and 3800 (i.e., take, possession, or destruction of birds, their nests or eggs), and Section 3513 of the MBTA (16 USC, Section 703 Supp. I 1989).

The impact to nesting birds would be less than significant if construction activities occur during the non-breeding season (i.e., from September 16 through January 31). However, construction activities conducted during the breeding season between February 1 and September 15 could affect these species adversely and result in a **potentially significant** impact. With the implementation of **Mitigation Measures BIO-2a**, **BIO-5**, and **BIO-6,** the project's impact to nesting birds would be considered **less than significant**.

Western Pond Turtle

Four CNDDB occurrences occur within five miles of the project site, with the nearest two occurrences (#1316 and 468) respectively from observations in 2016 in Carson Creek 0.5 mile west of the project and 1988 from Deer Creek where it crosses Latrobe Road 0.9 mile southeast of the project site. Suitable aquatic habitat for western pond turtle was determined to occur on the project site within the intermittent drainage when inundated and the annual grasslands near the drainage provide suitable upland nesting habitat. The proposed project has the potential to directly impact western pond turtle by causing physical harm to individuals or eggs if they are present in the project site during construction. Western pond turtle individuals could be harmed during construction fill and grading, which could crush individuals or occupied nests. Reductions in habitat quantity and quality could result from hydrological alterations related to culvert or bridge installation, grading, or through construction of impervious surfaces, which could prevent adults from utilizing the affected habitats for nesting. Reduction in water quality could also occur from the creation of exposed areas of bare soil. This would be considered a **potentially significant** impact. With the implementation of **Mitigation Measures BIO-3** and **BIO-4** through **BIO-7,** the project's impact to western pond turtle would be considered **less than significant**.

Special-Status Plants

Suitable habitat for six special-status plant species was determined to occur on the project site (see Table 3) based on reconnaissance-level surveys conducted from 2019 through 2021. All of the six species may occur in vernal pools or seasonal wetlands with similar hydrology. A botanical survey was conducted according to agency protocol in April 2022 (**Appendix C**). The survey was conducted during the evident and identifiable period of special-status plants with potential to occur. The entire project site was included but extra effort was expended in vernal pools and wetlands where special-status plants were more likely to occur. No special-status plants were observed. The project will have **no impact** to special-status plants.

b) **Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?**

Less than Significant with Mitigation Incorporated. CDFW's *California Natural Communities List* (CDFW, 2023d) ranks vegetation alliances in California according to their degree of rarity imperilment (as measured by rarity, trends, and threats). All alliances are listed with a G (global) and S (state) rank. Alliances with state ranks of S1-S3 are considered of special concern by CDFW, and all associations within them are also considered to be highly imperiled. The following vegetation alliances found within the Project site are considered of special concern by CDFW and should therefore be considered a sensitive natural community under CEQA regulations:

- *Eryngium vaseyi* (42.007.06) Coyote-thistle vernal pools (state rank of S2)
- *Salix gooddingii* (61.211.01) Goodding's willow thickets (state rank of S3)

The project grading will remove approximately 0.11 acre of Goodding's willow thickets and 0.065 acre of coyote-thistle vernal pools. The removal of this habitat would result in a potentially significant impact on habitat types identified as sensitive natural communities by the California Department of Fish and Wildlife. Because these habitats are considered sensitive biological communities by CDFW and have substantial value to wildlife, loss would be considered a **potentially significant** impact. With the implementation of **Mitigation Measures BIO-4** through **BIO-7**, the project's impact to sensitive habitats would be considered **less than significant**.

c) **Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?**

Less than Significant with Mitigation Incorporated. The project site supports wetlands and other waters that may be subject to USACE jurisdiction under Section 404 of the CWA and/or regulation under the Porter-Cologne Act, California Fish and Game Code Section 1600 et seq. and the State Wetland Dredge and Fill Policy. Section 404 of the

CWA requires that a permit be obtained from USACE prior to the discharge of dredged or fill materials into any "waters of the United States," which includes wetlands. Section 404 permits generally require mitigation to offset losses of these habitat types, in accordance with Executive Order 11990, which is intended to result in no net loss of wetland values or acres. These features may also be protected under state regulations, including the Porter-Cologne Act, California Fish and Game Code, and the State Wetland Dredge and Fill Policy.

Development of the proposed project would result in the loss of potentially jurisdictional wetlands and other waters of the U.S. or State protected waters/wetlands as summarized in **Table 5**.

These features would be directly affected through grading. The loss of wetlands and other waters of the U.S. or State protected waters/wetlands is considered **potentially significant** impacts. With the implementation of **Mitigation Measures BIO-4** through **BIO-7,** the project's impact to state or federally protect wetlands would be considered **less than significant**.

TABLE 5
SUMMARY OF IMPACTS TO AQUATIC RESOURCES

Aquatic Resource		Acres
Culvert		0.003
Ephemeral Drainage		1.190
Intermittent Drainage		0.641
Riparian Wetland		0.113
Riverine Seasonal Wetland		0.165
Seasonal Wetland		0.069
Seep		1.053
Vernal Pool		0.065
Wetland Swale		0.789
	Total:	**4.088**

d) **Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?**

Less than Significant with Mitigation Incorporated. The project site and surrounding area could potentially be used by a variety of wildlife species for dispersal and seasonal migration. However, there are no known wildlife movement corridors on or in the vicinity of the project site. The project site is not located in an "Important Biological Corridor" designated by the El Dorado County (2004) General Plan nor is it in important habitat for migratory deer herds (El Dorado County 2010). Because there are no known wildlife corridors or migration routes through or in the vicinity of the project site, the

project's impacts to wildlife corridors and migration routes would be **less than significant**.

As discussed above under Topic a), there is a nesting colony of tri-colored blackbird in a riparian wetland feature in the western section of the project site. Disturbance of active nest sites which results in nest abandonment, loss of young, or reduced health and vigor of eggs and/or nestlings (resulting in reduced survival rates), or the direct removal of vegetation that supports nesting birds which result in killing of nestlings or fledgling bird species would be considered a **potentially significant** impact. In addition, this colony is considered a native wildlife nursery site. Therefore, construction activities that result in the removal of, or disturbance to, the colony, even outside of the nesting season, would be considered a **potentially significant** impact.

Project grading will result in the removal of approximately 0.06 acre of tri-colored blackbird nesting habitat (Riparian Wetland [RW] 11). In other portions of the nesting habitat the limits of grading will be approximately 15 to over 100 feet away. Human disturbances and noise from construction activities have the potential to cause colony abandonment and death of young or loss of reproductive success during nesting season. Nesting birds could be adversely affected if the colony is exposed to a substantial increase in noise or human presence during project construction. This would be considered a **potentially significant** impact. With the implementation of **Mitigation Measures BIO-2a, BIO-5**, and **BIO-6**, the project's impact to native nursery sites would be considered **less than significant**.

e) **Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?**

Less than Significant. The project site supports 0.75 acre of blue oak woodland regulated under the El Dorado County Oak Resources Conservation Ordinance (County Code §130.39). Project grading will remove approximately 0.20 acre of the blue oak woodland. The County ordinance requires mitigation at a 1:1 ratio for projects that remove less than 50% of on-site oak woodland. Mitigation may be in the form of an in-lieu fee to the County (used to conserve oak woodland in high priority areas of the County pursuant to the El Dorado County [2017] Oak Resources Management Plan), offsite conservation, replacement planting, or a combination of those methods. The mitigation is included as part of a development application and approved by the County as part of the review process. The project will remove oak woodland, but will not conflict with the local ordinance because mitigation will be required as part of the local approval process. The project will not conflict with any other local policies or ordinances protecting biological resources.

f) **Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?**

No impact. The proposed project is not located within an adopted Habitat Conservation Plan, Natural Community Conservation Plan, Oak Woodland Priority Conservation Area (El Dorado County 2017), or Ecological Preserves Overlay (El Dorado County 2004). Therefore, there would be **no impact**.

Mitigation Measures

Mitigation Measure BIO-1: Compensate for the Loss of Habitat for Vernal Pool Species.

The Project shall purchase at least 0.12 vernal pool preservation credits (2:1 ratio for 0.065 acre of impacts) and 0.065 acre of vernal pool creation credits (1:1 ratio) at a conservation bank approved by USFWS for vernal pool fairy and tadpole shrimp with a service area including the Project, or at a conservation bank with a service area not including the Project upon further approval of USFWS. Proof of purchase shall be provided to USFWS and El Dorado County prior to the initiation of any Project construction within 250 feet of vernal pools 1, 3, or 4.

Mitigation Measure BIO-2a: Perform Pre-Construction Surveys for Nesting Special-Status and Common Migratory Birds.

If construction activities begin during the nesting season (February 1 to September 15), a qualified biologist (as approved by CDFW) shall conduct a preconstruction survey for active nests in suitable nesting habitat within 500 feet of the construction area for nesting raptors and migratory birds. Areas adjacent to the project site that are inaccessible due to private property restrictions shall be surveyed using binoculars from the nearest vantage point. The survey shall be conducted by a qualified biologist no more than seven days prior to the onset of construction. If no active nests are identified during the pre-construction survey, no further mitigation is necessary. If construction activities begin prior to February 1, it is assumed that no birds would nest in the project site during active construction activities and no pre-construction surveys are required. If at any time during the nesting season construction stops for a period of two weeks or longer, pre-construction surveys shall be conducted prior to construction resuming.

If active nests are found during the survey, the project proponent shall implement mitigation measures to ensure that the nests would not be adversely affected, which would include establishing a no-work buffer zone, as approved by CDFW, around the active nest.

Measures shall include, but not be limited to:

a. If active nests are found on or within 500 feet of the project site, then the project proponent shall establish no disturbance buffers for active nests of 250 feet for migratory bird species and 500 feet for special-status species and raptor species, until the breeding season has ended, or until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival.

b. Depending on conditions specific to each nest, and the relative location and rate of construction activities, it may be feasible for construction to occur as planned within the buffer without impacting the breeding effort. In this case (to be determined on a case-by-case basis), the nest(s) shall be monitored by a qualified biologist during any

construction activities within the buffer. If, in the professional opinion of the monitor, the project would impact the nesting birds or young, the biologist shall immediately inform the construction manager and the project proponent shall notify CDFW. The construction manager shall stop construction activities within the buffer until the nest is no longer active or a new buffer distance is agreed upon with CDFW. Completion of nesting and fledging activities shall be determined by a qualified biologist.

c. If construction begins outside of the breeding season (February 1 through September 15), then the project proponent is permitted to continue construction activities throughout the breeding season.

Mitigation Measure BIO-2b: Perform Pre-Construction Surveys for Burrowing Owl

1. Pre-construction surveys for burrowing owls shall be conducted by a qualified biologist (as approved by CDFW) prior to where construction is planned in known or suitable habitat and within 500 feet of the project site. Areas adjacent to the project site that are inaccessible due to private property restrictions shall be surveyed using binoculars from the nearest vantage point. Surveys shall be conducted no more than 30 days and no less than 14 days prior to the commencement of construction activities. If construction activities are delayed for more than 30 days after the initial preconstruction surveys, then a new preconstruction survey shall be required. All surveys shall be conducted in accordance with the *Staff Report on Burrowing Owl Mitigation* (CDFW, 2012). This mitigation shall be implemented by the project proponent.

2. If burrowing owls are discovered in project site during construction, the CDFW-approved project biologist shall be notified immediately. Occupied burrows shall not be disturbed during the nesting season (February 1 through August 31) unless a qualified biologist approved by the CDFW verifies through non-invasive methods that either: (1) the owls have not begun egg-laying and incubation; or (2) that juveniles from the occupied burrows are foraging independently and are capable of independent survival.

3. If active burrows are observed within 500 feet of the project site, an impact assessment shall be prepared and submitted to the CDFW, in accordance with the *Staff Report on Burrowing Owl Mitigation* (CDFW, 2012). If it is determined that project activities may result in impacts to nesting, occupied, and satellite burrows and/or burrowing owl habitat, the project proponent shall delay commencement of construction activities until the biologist determines that the burrowing owls have fledged and the burrow is no longer occupied. If this is infeasible, the project applicant shall consult with CDFW and develop a detailed mitigation plan such that the habitat acreage, number of burrows, and burrowing owls impacted are replaced. The mitigation plan shall be based on the requirements set forth in Appendix F of the *Staff Report on Burrowing Owl Mitigation* (CDFW, 2012). No construction can commence until CDFW has approved the mitigation plan.

Mitigation Measure BIO-3: Perform Pre-Construction Surveys for Western Pond Turtle and Monitoring of In-water Work

To minimize adverse impacts on western pond turtles and their habitat from project construction activities occurring within suitable habitat (intermittent stream and adjacent uplands), the project proponent and/or its contractor(s) shall implement the following

measure during construction activities that require in-water work or ground disturbance within 300 feet of aquatic habitat in uninterrupted upland habitat (or within suitable upland habitat [e.g., annual grassland or valley foothill riparian]) or suitable aquatic habitat to minimize adverse impacts on western pond turtles and their habitat:

- A qualified biologist shall be retained to conduct a pre-construction survey for western pond turtle in suitable upland and aquatic habitat within 300 feet of aquatic habitat (unless the qualified biologist reduces the distance) in or adjacent to the work area before the installation of dewatering and diversion devices. To prevent entrapment within the active work area, the biologist shall monitor any potential dewatering and/or diversion work to rescue and relocate western pond turtles and other native aquatic wildlife species from to suitable habitat outside the work area, consistent with USFWS and CDFW authorization.

- All equipment (e.g., buckets, boots, waders) that will contact water shall be sterilized in accordance with the CDFW Aquatic Invasive Species Disinfection/Decontamination Protocols (https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=92821) or current guidance.

Mitigation Measure BIO-4: No Net Loss of Aquatic Habitats

The project proponent shall demonstrate that there is no net loss of wetlands and other waters of the United States or State. To ensure this, wetland mitigation shall be developed as a part of the permitting process. Mitigation shall be provided prior to construction-related impacts to the existing waters/wetlands. The exact mitigation ratio would be determined in consultation with the applicable permitting agencies, which may include USACE, CDFW, and/or RWQCB. The amount of mitigation will be based on the type and value of the waters/wetlands affected by the project, and will be determined in consultation with the USACE, RWQCB, and/or CDFW during the regulatory permitting process. Compensation shall take the form of preservation or creation in accordance with USACE, RWQCB and/or CDFW mitigation requirements, as required under project permits. Preservation and creation may occur offsite through purchasing credits at a USACE, CDFW, and/or RWQCB-approved mitigation bank.

Mitigation Measure BIO-5: Conduct Environmental Awareness Training

Before any work occurs in the project site, including grading and equipment staging, all construction personnel shall participate in an environmental awareness training regarding special-status species and sensitive habitats present in the project site. If new construction personnel are added to the project, they must receive the mandatory training before starting work. As part of the training, an environmental awareness handout shall be provided to all personnel that describe and illustrates sensitive resources to be avoided during project construction.

Mitigation Measure BIO-6: Install Temporary Barrier Fencing, and/or Flagging to Protect Environmentally Sensitive Habitat Areas

Before any ground-disturbing activity occurs within the project site, the project proponent shall ensure that temporary orange barrier fencing is installed around the project site adjacent to sensitive habitat areas to be avoided, as appropriate. Construction personnel and construction activities shall avoid areas outside the fencing. The exact location of the

fencing shall be determined by the resident engineer coordinating with a qualified biologist, with the goal of protecting sensitive biological habitat and water quality.

The fencing material shall consist of temporary plastic mesh-type construction fence (Tensor Polygrid or equivalent) installed between the work area and environmentally sensitive habitat areas (i.e., waters of the U.S., special-status wildlife habitat, active bird nests), as appropriate. To minimize potential ground disturbance, the base of the fencing shall not be buried or keyed-in.

Installation of the barrier fence shall occur under the supervision of a qualified biologist. The temporary orange barrier fencing shall also be installed in a manner that is consistent with applicable water quality requirements contained within the project's Stormwater Pollution Prevention Plan (SWPPP) or Water Pollution Control Plan (WPCP). The fencing shall be shown on the final construction documents. The fencing shall be checked regularly and maintained until all construction is complete. No construction activity shall be allowed until this condition is satisfied.

Mitigation Measure BIO-7: Implement Best Management Practices to Protect Water Quality

Subject to requirements of Section 402 of the federal Clean Water Act, and the National Pollutant Discharge Elimination System (NPDES) permitting process, all construction projects that disturb more than one acre of land are required to prepare and implement a stormwater pollution prevention plan (SWPPP). The SWPPP is incorporated into all project plans and specifications. The restoration construction contractor(s) will be required to post a copy of the SWPPP at the project location, file a notice of intent to discharge stormwater with the RWQCB, and implement all measures required by the SWPPP. A Qualified SWPPP Practitioner (QSP) will be responsible for construction monitoring to ensure that the provisions of the SWPPP are effectively enforced. In the event of noncompliance, the QSP will have the authority to shut down the construction site or fine the responsible party or parties.

The SWPPP will include the following information and Best Management Practices (BMPs).

- A description of site characteristics, including runoff and drainage characteristics and soil erosion hazard.
- A description of proposed construction procedures and construction-site housekeeping BMPs, including prohibitions on discharging or washing potentially harmful materials into roads or drainages.
- A description of BMPs that will be implemented for erosion and sediment control, including requirements to:
  - Conduct major construction activities involving excavation and spoils haulage during the dry season, to the extent possible.
  - Conduct all construction work in accordance with site-specific construction plans that minimize the potential for increased sediment inputs to surface waters.

- Grade and stabilize spoils sites to minimize erosion and sediment input to surface waters and generation of airborne particulate matter.
- Implement erosion control measures as appropriate to prevent sediment from entering surface waters to the extent feasible, including the use of silt fencing or fiber rolls to trap sediments.
- Install fiber rolls, or other equivalent erosion and sediment control measures between the project site and aquatic resources, as necessary, to ensure that construction debris and sediment does not inadvertently enter these features. All areas of exposed soil shall be covered or otherwise stabilized 48 hours prior to potential precipitation events of greater than 0.5 inch. In addition, in order to minimize ground disturbance, fiber rolls or other equivalent control measures shall not be keyed-in or buried.
- Immediately after project construction is complete, all exposed soil shall be stabilized. Soil stabilization may include, but is not limited to, seeding with a native grass seed mix and planting native plants.
- Fiber rolls, or other equivalent erosion and sediment control measures shall not be removed from the project site until vegetation has reestablished within all temporarily-impacted areas to at least 70 percent of pre-project vegetation cover conditions or better.
- No refueling, storage, servicing, or maintenance of equipment shall take place within 100 feet of aquatic resources.
- All machinery used during construction of the project shall be properly maintained and cleaned to prevent spills and leaks that could contaminate soil or water.
- Any spills or leaks from construction equipment (i.e., fuel, oil, hydraulic fluid, and grease) shall be cleaned up in accordance with applicable local, state, and/or federal regulations.
- Implement construction vehicle track-out controls. Restrict vehicle use to properly designated exit points and wherever construction vehicle entry/exit points intersect paved roads, provisions must be made to minimize the transport of sediment (mud) onto the paved road prior to the use of these access points.

- A Spill Prevention and Response Plan that identifies any hazardous materials to be used during construction; describes measures to prevent, control, and minimize spillage of hazardous substances; describes transport, storage and disposal procedures for these substances; and outlines procedures to be followed in case of a spill of a hazardous material. The Spill Prevention and Response Plan will require that hazardous and potentially hazardous substances stored onsite be kept in securely closed containers located away from drainage courses and areas where stormwater is allowed to infiltrate. Spill prevention kits will be required to be kept in close proximity to construction areas and workers will be trained in their use. It will also stipulate procedures, such as the use of spill containment pans, to minimize

hazard during onsite fueling and servicing of construction equipment. Finally, the Spill Prevention and Response Plan will require that all agencies listed in the Spill Prevention and Response Plan be notified immediately of any substantial spill or release.

- A stipulation that construction will be monitored by a QSP to ensure that contractors are adhering to all provisions relevant to state and federal stormwater discharge requirements, and that the QSP will shut down the construction site in the event of noncompliance.

October 13, 2023

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)

(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

https://www.fws.gov/sites/default/files/documents/endangered-species-consultation-handbook.pdf

Migratory Birds: In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts, see https://www.fws.gov/program/migratory-bird-permit/what-we-do.

The MBTA has no provision for allowing take of migratory birds that may be unintentionally killed or injured by otherwise lawful activities. It is the responsibility of the project proponent to comply with these Acts by identifying potential impacts to migratory birds and eagles within applicable NEPA documents (when there is a federal nexus) or a Bird/Eagle Conservation Plan (when there is no federal nexus). Proponents should implement conservation measures to avoid or minimize the production of project-related stressors or minimize the exposure of birds and their resources to the project-related stressors. For more information on avian stressors and recommended conservation measures, see https://www.fws.gov/library/collections/threats-birds.

In addition to MBTA and BGEPA, Executive Order 13186: *Responsibilities of Federal Agencies to Protect Migratory Birds*, obligates all Federal agencies that engage in or authorize activities that might affect migratory birds, to minimize those effects and encourage conservation measures that will improve bird populations. Executive Order 13186 provides for the protection of both migratory birds and migratory bird habitat. For information regarding the implementation of Executive Order 13186, please visit https://www.fws.gov/partner/council-conservation-migratory-birds.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Code in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Attachment(s):

- Official Species List

OFFICIAL SPECIES LIST

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

Sacramento Fish And Wildlife Office
Federal Building
2800 Cottage Way, Room W-2605

PROJECT SUMMARY

Project Code: 2024-0004896
Project Name: Creekside Village
Project Type: New Constr - Above Ground
Project Description: To inform a biological assessment
Project Location:

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@38.6201229,-121.05382599836545,14z

Counties: El Dorado and Sacramento counties, California

ENDANGERED SPECIES ACT SPECIES

There is a total of 11 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

AMPHIBIANS

NAME	STATUS
California Red-legged Frog *Rana draytonii* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/2891	Threatened
California Tiger Salamander *Ambystoma californiense* Population: U.S.A. (Central CA DPS) There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/2076	Threatened
Foothill Yellow-legged Frog *Rana boylii* Population: South Sierra Distinct Population Segment (South Sierra DPS) No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/5133	Proposed Endangered

INSECTS

NAME	STATUS
Monarch Butterfly *Danaus plexippus* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/9743	Candidate
Valley Elderberry Longhorn Beetle *Desmocerus californicus dimorphus* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/7850	Threatened

CRUSTACEANS

NAME	STATUS
Vernal Pool Fairy Shrimp *Branchinecta lynchi* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/498	Threatened
Vernal Pool Tadpole Shrimp *Lepidurus packardi* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/2246	Endangered

FLOWERING PLANTS

NAME	STATUS
El Dorado Bedstraw *Galium californicum ssp. sierrae* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/5209	Endangered
Pine Hill Ceanothus *Ceanothus roderickii* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/3293	Endangered
Pine Hill Flannelbush *Fremontodendron californicum ssp. decumbens* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/4818	Endangered
Stebbins' Morning-glory *Calystegia stebbinsii* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/3991	Endangered

CRITICAL HABITATS

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

YOU ARE STILL REQUIRED TO DETERMINE IF YOUR PROJECT(S) MAY HAVE EFFECTS ON ALL ABOVE LISTED SPECIES.

memorandum

date	June 6, 2022
to	George Carpenter, Winn Communities
cc	Erich Fischer and Eric Christensen, Environmental Science Associates (ESA)
from	Jacky Daley, ESA
subject	Results of a Tri-colored Blackbird Survey for Creekside Village, El Dorado County, CA

The purpose of this memorandum is to summarize the results of a survey for tri-colored blackbird (*Agelaius tricolor*, TRBL), a California threatened species and a State species of special concern, that took place in western El Dorado County, California, on April 19, 2022, as part of the Creekside Village (**Figure 1**) Environmental Evaluation. The survey covered the entirety of the Creekside Village Project site, focusing on areas of suitable TRBL nesting habitat, based on past records of nesting colonies near the Project.

Methods

Occurrences of past California Natural Diversity Database (CNDDB) records were reviewed the prior to conducting the survey. ESA biologists conducted the TRBL survey on Tuesday, April 19, 2022 from 8:00a.m. to 8:45a.m. and focused on suitable nesting habitat near Carson Creek. Conditions ranged from light rains, to overcast, to mostly sunny conditions throughout the day, winds of 4 to 8mph, and temperatures ranging from 49-69°Fahrenheit. Biologists, Natalie Lamas and Amanda Seguro-Moon, conducted the survey of the blackberry shrubs, and some nearby willows, for TRBL using Nikon Monarch 8x42 binoculars.

Results

Background CNDDB data reviewed show that three occurrence records (occurrence numbers 512, 513, and 514) are located within a one-mile radius, and one of these records is located within the Project site (occurrence number 1012)[1]. TRBL was observed at the on-site occurrence in 2005, 2014, and 2015. No other observation records of nesting activity by the species are recorded within CNDDB during subsequent years. Three additional occurrence records are recorded within a broader 15-mile radius of the project, also northeast of the Project site[1].

[1] California Department of Fish and Wildlife. California Natural Diversity Database (CNDDB) RareFind 5. Retrieved May 13, 2022, from https://apps.wildlife.ca.gov/rarefind/view/RareFind.aspx.

One TRBL nesting colony was observed within two large clusters of Himalayan blackberry in two riparian wetlands during the survey. These blackberry shrubs are located within the northwest corner of the Project site south of Carson Creek in riparian wetlands along a tributary to Carson Creek and along an associated tributary that runs from the southeast to the northwest extent of the Project site parallel to the northern boundary (**Figure 2**). TRBL were heard vocalizing and the distinct white band under the red shoulder was observed on several individuals of male blackbirds (this characteristic is only evident on males) in the colony. Several grass cup nests were observed within the blackberry shrubs and, combined with the presence of males vocalizing, confirmed TRBL nesting activity. Tri-colored blackbirds observed exhibiting potential breeding behavior were watched for approximately 45 minutes. While individual nests were observed, the presence of eggs or young could not be confirmed. Due to the concurrent presence of numerous red-winged blackbirds (*Agelaius phoeniceus*), identical nests of TRBL and red-winged blackbirds, and the tangled nature of the nesting substrate, the approximate number of TRBL nests could not accurately be estimated.

Subject: Botanical Survey Results for Creekside Village, El Dorado County, CA

Dear Mr. Carpenter:

Environmental Science Associates (ESA) conducted a botanical survey at the Creekside Village (Project) study area on April 19, 2022, in western El Dorado County, California. The purpose of the survey was to determine if special-status plants occur in the study area in order to support environmental review by the County and regulatory agencies. The purpose of this letter is to document the methods and results of the survey. No special-status plants were found in the study area.

Location

The study area is an approximately 241.38-acre undeveloped area located in El Dorado Hills, an unincorporated community. The study area is located west of Latrobe Road, between Investment Boulevard and Wetsel-Oviatt Road (**Figure 1**). The study area is in Sections 24 and 25 of Township 9 North Range 8 East on the Folsom SE, California U.S. Geological Survey (USGS) 7.5 series quadrangle (USGS 2022). The study area is in the Upper Consumes River Watershed (hydrologic unit code 18040013). Elevation ranges from approximately 476 feet to 642 feet.

The study area is not located in an Important Biological Corridor or Ecological Preserves overlay in the El Dorado County (2004) General Plan. The study area is not in critical habitat for any federally listed species (USFWS 2022). The study area is in County Rare Plant Mitigation Area 2 (County Code §130.71), which is defined as the El Dorado Irrigation District (EID) Service Area. The County charges a standard fee for development in Mitigation Area 2 to mitigate for EID impacts to special-status plants elsewhere in the County.

Database Queries

A list of federal listed, candidate, or proposed plants that potentially occur in or could be affected by projects within the boundary of the study area was obtained from the USFWS Sacramento Field Office. The California Natural Diversity Database (CNDDB) and California Native Plant Society online inventory were queried for known occurrences of special-status species on the Folsom SE and eight surrounding quads. The results of the database queries (**Attachment A**) were used to assemble a table of special-status plants evaluated (**Table 1**).

ESA

Review of Background Information

Publicly available and subscription-based biological resource data were reviewed prior to fieldwork. Data sources reviewed include:

- Current and historical topographic maps (USGS 2022);
- Current and historical aerial imagery (Google, Inc. 2022);
- Soil maps and information from the National Resources Conservation Service (NRCS 2022); and
- California Natural Diversity Database (CNDDB; CDFW 2022)

Environmental Setting

Regionally, the study area is in the low Sierra Nevada foothills of the California Floristic Province (Baldwin *et al.*, 2012), where the Sierra Nevada Mountains transition to the Central Valley. Topography in the study area drains generally from east to west and is characterized by low hills with gentle slopes. Vegetation communities in the study area are mostly California annual grassland, dominated by naturalized annual grasses although some native grasses and forbs are present. There is a small stand of blue oak woodland near the southeastern corner of the study area. Several creeks and swales flow across the study area, fed in part by seeps but also urban irrigation runoff. There are some small patches of riparian wetlands with willows along the creeks. There are some small, natural vernal pools in the study area, and some seasonal wetlands that have been altered by ranching activity but have similar hydrology. These features have characteristic vernal pool vegetation, and are the areas most likely to support special-status plants. None of the soils mapped in the Action Area have serpentinite or gabbro rock as a parent material (NRCS 2022).

The overall climate in the region is Mediterranean, which is characterized by hot, dry summers and cool, wet winters, with the bulk of precipitation occurring as rain in the winter months. The climate in the El Dorado Hills area is temperate with mean annual temperatures ranging from a high of 74 to a low of 50 degrees Fahrenheit (Western Regional Climate Center, 2021). Historic average annual precipitation at the Folsom Dam gauge is 23.89 inches. Historic average precipitation from July 1 through April 19 is 21.49 inches. From July 1, 2022 through April 19, 2022 (the date of the field survey), the Folsom Dam gauge recorded 14.85 inches of precipitation, or 69% of normal for that date (CDEC 2022).

Field Survey

ESA botanists Chuck Hughes, Amanda Segura-Moon, Jacky Daley, and Natalie Lamas conducted the field survey on April 19, 2022. The field survey followed the botanical survey guidelines of USFWS (1996) and CDFW (2018). The April 2022 fieldwork was conducted during the evident and identifiable period of special-status plants with potential to occur in the study area. Transects were walked approximately 50 feet apart. Frequent deviations were made from the transects to search areas of different microhabitat more suitable for special-status plants or for detecting additional plant species, especially the vernal pools and other wetlands.

ESA

Approximately 34 person hours were spent surveying the study area. An additional 2 person-hours were spent keying plants collected in the field. All vascular plants found in the study area were identified to the taxonomic level necessary to determine legal status. Scientific nomenclature follows the Jepson Flora Project (Jepson 2022), based on Baldwin *et al.* (2012).

Special-Status Species

Several species known to occur regionally are regulated pursuant to the federal or State endangered species acts. In addition, Section 15380(b) of the *CEQA Guidelines* provides a definition of rare, endangered, or threatened species that are not included in any listing.[1] Species recognized under these terms are collectively referred to as "special-status species." Special-status species or natural communities evaluated here are defined as:

- Species listed or proposed for listing as threatened or endangered under the federal Endangered Species Act (FESA) (50 Code of Federal regulations [CFR] 17.12 [listed plants], and various notices in the Federal Register [FR] [proposed species]);
- Species that are candidates for possible future listing as threatened or endangered under FESA (61 FR 40, February 28, 1996);
- Species listed or proposed for listing by the State of California as threatened or endangered under the California Endangered Species Act (CESA) (14 California Code of Regulations [CCR] 670.5);
- Plants listed as rare or endangered under the California Native Plant Protection Act (NPPA) (California Fish and Game Code, Section 1900 *et seq.*);
- Species that meet the definitions of rare and endangered under CEQA. CEQA provides that a plant or animal species may be treated as "rare or endangered" even if not on one of the official lists (14 CCR 15380);
- Plants ranked by CNPS as "rare, threatened or endangered in California" (California Rare Plant Rank [CRPR] 1A, 1B, and 2) meet CEQA significance criteria and State Fish and Game Code sections 1901, 2062 and 2067 criteria as rare, threatened, or endangered species;
- Bisbee Peak rush-rose (*Crocanthemum* [=*Helianthemum*] *suffrutescens*), a CRPR 3 plant, is also included because it is regulated by El Dorado County code (§130.71).

Each of the special-status species from the queries in Attachment A is evaluated in Table 1. The table provides a summary of the special-status species, their general habitat requirements, and an assessment of their potential to occur in the study area. The "Potential for Occurrence" categories are defined as follows:

- **Unlikely:** The study area does not support suitable habitat for a particular species, does not provide soils required for the species to inhabit, or is outside of the species known elevation or geographic range;

[1] For example, vascular plants listed as rare or endangered or as Rank 1 or 2 by the California Native Plant Society (CNPS) are considered to meet Section 15380(b) requirements.

ESA

- **Low:** The study area only provides limited amounts and low quality habitat for a particular species. In addition, the known range for a particular species may be outside of the immediate study area;
- **Moderate:** The study area provides suitable habitat for a particular species;
- **High:** The study area provides ideal habitat conditions for a particular species and/or known populations occur in immediate area and/or within the study area; or
- **Present:** The species was observed during the biological surveys within the study area.

TABLE 1
REGIONAL SPECIAL-STATUS PLANTS

Common Name *Scientific Name*	Listing Status USFWS/CDFW/ CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Plants			
Jepson's onion *Allium jepsonii*	--/--/1B.2	Open, serpentine or volcanic chaparral, cismontane woodland, or lower montane coniferous forest. Blooms April – August. Elevation 985 – 4,330 feet.	**Unlikely.** Suitable soils are not present.
Ione manzanita *Arctostaphylos myrtifolia*	FT/--/1B.2	Acidic sandy or clay soils (Ione soils) in chaparral or cismontane woodland. Blooms November – March. Elevation 195 – 1,905 feet.	**Unlikely.** Suitable soils are not present. The site is outside the very limited geographic range.
Stebbin's morning-glory *Calystegia stebbinsii*	FE/SE/1B.1	Gabbroic or serpentine soils in chaparral or cismontane woodland. Blooms April – July. Elevation 605 – 3,575 feet.	**Unlikely.** Suitable soils are not present.
Chaparral sedge *Carex xerophila*	--/--/1B.2	Gabbro or serpentine soils in chaparral, cismontane woodland, or lower montane coniferous forest. Blooms March – June. Elevation 1,445 – 2,525 feet.	**Unlikely.** Suitable soils are not present. The site is below the elevation range.
Pine Hill ceanothus *Ceanothus roderickii*	FE/SR/1B.1	Gabbroic or serpentine soils in chaparral or cismontane woodland. Blooms April – June. Elevation 805 – 3,575 feet.	**Unlikely.** Suitable soils are not present.
Red Hills soaproot *Chlorogalum grandiflorum*	--/--/1B.2	Gabbro or serpentine soils in chaparral, cismontane woodland, or lower montane coniferous forest. Blooms May – June. Elevation 805 – 5,545.	**Unlikely.** Suitable soils are not present.
Bisbee Peak rush rose *Crocanthemum suffrutescens*	--/--/3.2	Gabbroic or Ione soils that are disturbed or burned in or near chaparral. Blooms April – August. Elevation 245 – 2,200 feet.	**Unlikely.** Suitable soils and habitat are not present.
Dwarf downingia *Downingia pusilla*	--/--/2B.2	Vernal pools and mesic valley/foothill grassland. Blooms March – May. Elevation up to 1,460 feet.	**Moderate.** Suitable habitat is present in the vernal pools and some seasonal wetlands.
Ione buckwheat *Eriogonum apricum* var. *apricum*	FE/SE/1B.1	Ione soils in openings of chaparral. Blooms July – October. Elevation 195 – 475 feet.	**Unlikely.** Suitable soils and habitat are not present. The site is outside the very limited geographic range.

TABLE 1
REGIONAL SPECIAL-STATUS PLANTS

Common Name *Scientific Name*	Listing Status USFWS/CDFW/ CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Irish Hill buckwheat *Eriogonum apricum* var. *prostratum*	FE/SE/1B.1	Ione soils in openings of chaparral. Blooms June – July. Elevation 295 – 395 feet.	**Unlikely.** Suitable soils and habitat are not present. The site is outside the very limited geographic range.
Tuolumne button-celery *Eryngium pinnatisectum*	–/–/1B.2	Vernal pools and mesic areas of cismontane woodland and lower montane coniferous forest. Blooms May – August. Elevation 230 – 3,000 feet.	**Moderate.** Suitable habitat is present in the vernal pools and some seasonal wetlands.
Pine Hill flannelbush *Fremontodendron decumbens*	FE/SR/1B.2	Rocky gabbroic or serpentine chaparral or cismontane woodland. Blooms April – July. Elevation 1,395 – 2,495 feet.	**Unlikely.** Suitable soils are not present. The site is below the elevation range.
El Dorado bedstraw *Galium californicum* subsp. *sierrae*	FE/SR/1B.2	Gabbroic soil in chaparral, cismontane woodland, or lower montane coniferous forest. Blooms May – June. Elevation 330 – 1,920 feet.	**Unlikely.** Suitable soils are not present.
Boggs Lake hedge-hyssop *Gratiola heterosepala*	–/SE/1B.2	Clay soils in shallow water of vernal pools or lake margins. Blooms April – August. Elevation up to 7,790 feet.	**Moderate.** Suitable habitat is present in the vernal pools and some seasonal wetlands.
Parry's horkelia *Horkelia parryi*	–/–/1B.2	Chaparral or cismontane woodland. Sometimes on Ione soils. Blooms April – September. Elevation 260 – 3,510 feet.	**Low.** Preferred soils are not present, and cismontane woodland is very limited in the study area.
Ahart's dwarf rush *Juncus leiospermus* var. *ahartii*	–/–/1B.2	Mesic valley and foothill grassland or vernal poos. Blooms March – May. Elevation 100 – 750 feet.	**Moderate.** Suitable habitat is present in the vernal pools and some seasonal wetlands.
Legenere *Legenere limosa*	–/–/1B.1	Vernal pools. Blooms April – June. Elevation up to 2,885 feet.	**Moderate.** Suitable habitat is present in the vernal pools and some seasonal wetlands.
Pincushion navarretia *Navarretia myersii* subsp. *myersii*	–/–/1B.1	Vernal pools, often in acidic soils. Blooms April – May. Elevation 65 – 1,085 feet.	**Moderate.** Suitable habitat is present in the vernal pools and some seasonal wetlands.
Slender Orcutt grass *Orcuttia tenuis*	FT/SE/1B.1	Vernal pools, often gravelly soils. Requires prolonged inundation of larger pools (>0.2 acre). Blooms May – September (October). Elevation 115 – 5,775 feet.	**Unlikely**. Although the project site supports vernal pools, they are not large enough nor do they remain inundated long enough to support this species.
Sacramento Orcutt grass *Orcuttia viscida*	FE/SE/1B.1	Vernal pools. Requires prolonged inundation period of larger pools (>0.1 acre). Blooms April – July (September). Elevation 100 – 330 feet.	**Unlikely**. Although the project site supports vernal pools, they are not large enough nor do they remain inundated long enough to support this species.
Layne's ragwort *Packera layneae*	FT/SR/1B.2	Rocky serpentine or gabbroic soils in chaparral or cismontane woodland. Blooms April – August. Elevation 655 – 3,560 feet.	**Unlikely.** Suitable soils are not present.

ESA

TABLE 1
REGIONAL SPECIAL-STATUS PLANTS

Common Name *Scientific Name*	Listing Status USFWS/CDFW/ CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Sanford's arrowhead *Sagittaria sanfordii*	--/--/1B.2	Shallow freshwater marshes and swamps, ponds, ditches. Aquatic emergent perennial herb that may bloom from late spring into the autumn. Blooms May – October (November). Elevation up to 2,135 feet.	**Low.** Most of the aquatic habitats do not inundate long enough to support this species. There is limited habitat in some of the aquatic habitats that receive warm-season irrigation runoff from nearby development. Most regional records are in the Central Valley and not the foothills.
El Dorado County mule ears *Wyethia reticulata*	--/--/1B.2	Clay or gabbroic substrates in chaparral, cismontane woodland, or lower montane coniferous forest. Blooms April – August. Elevation 605 – 2,065.	**Unlikely.** Suitable soils are not present.

STATUS CODES:

FEDERAL (U.S. Fish and Wildlife Service):

FE = Listed as Endangered by the Federal Government
FT = Listed as Threatened by the Federal Government
FC = Candidate for Federal Listing

STATE (California Department of Fish and Wildlife):

SE = Listed as Endangered by the State of California
ST = Listed as Threatened by the State of California
SSC = California species of special concern
CFP = California fully protected bird species
WL = CDFW Watch List

California Native Plant Society (CNPS):

Rank 1A = Plants presumed extirpated in California and either rare or extinct elsewhere
Rank 1B = Plants rare, threatened, or endangered in California and elsewhere
Rank 2A = Plants presumed extirpated in California but common elsewhere
Rank 2B = Plants rare, threatened, or endangered in California but more common elsewhere
Rank 3 = Plants about which more information is needed
Rank 4 = Plants of limited distribution

CNPS Code Extensions

.1 = Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
.2 = Fairly threatened in California (20-80% occurrences threatened)
.3 = Not very threatened in California (less than 20% of occurrences threatened or no current threats known)

Results

A list of all plants observed in the study area is in **Attachment B**. A map of the botanical survey area is in **Attachment C**. No special status species were observed.

Cordially,

Chuck Hughes, M.S.
Senior Biologist/Botanist

October 30, 2021

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, under the jurisdiction of the U.S. Fish and Wildlife Service (Service) that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the Service under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

Please follow the link below to see if your proposed project has the potential to affect other species or their habitats under the jurisdiction of the National Marine Fisheries Service:

http://www.nwr.noaa.gov/protected_species/species_list/species_lists.html

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to

utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http://www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Attachment(s):

- Official Species List

Official Species List

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

Sacramento Fish And Wildlife Office

Project Summary

Consultation Code: 08ESMF00-2022-SLI-0256
Event Code: Some(08ESMF00-2022-E-00742)
Project Name: Creekside Village
Project Type: DEVELOPMENT
Project Description: Residential
Project Location:

Approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@38.623642000000004,-121.0553657202736,14z

Counties: El Dorado County, California

Endangered Species Act Species

There is a total of 13 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

Reptiles

NAME	STATUS
Giant Garter Snake *Thamnophis gigas* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/4482	Threatened

Amphibians

NAME	STATUS
California Red-legged Frog *Rana draytonii* There is **final** critical habitat for this species. The location of the critical habitat is not available. Species profile: https://ecos.fws.gov/ecp/species/2891	Threatened
California Tiger Salamander *Ambystoma californiense* Population: U.S.A. (Central CA DPS) There is **final** critical habitat for this species. The location of the critical habitat is not available. Species profile: https://ecos.fws.gov/ecp/species/2076	Threatened

Fishes

NAME	STATUS
Delta Smelt *Hypomesus transpacificus* There is **final** critical habitat for this species. The location of the critical habitat is not available. Species profile: https://ecos.fws.gov/ecp/species/321	Threatened

Insects

NAME	STATUS
Monarch Butterfly *Danaus plexippus* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/9743	Candidate
Valley Elderberry Longhorn Beetle *Desmocerus californicus dimorphus* There is **final** critical habitat for this species. The location of the critical habitat is not available. Species profile: https://ecos.fws.gov/ecp/species/7850	Threatened

Crustaceans

NAME	STATUS
Vernal Pool Fairy Shrimp *Branchinecta lynchi* There is **final** critical habitat for this species. The location of the critical habitat is not available. Species profile: https://ecos.fws.gov/ecp/species/498	Threatened
Vernal Pool Tadpole Shrimp *Lepidurus packardi* There is **final** critical habitat for this species. The location of the critical habitat is not available. Species profile: https://ecos.fws.gov/ecp/species/2246	Endangered

Flowering Plants

NAME	STATUS
El Dorado Bedstraw *Galium californicum ssp. sierrae* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/5209	Endangered

subject	Updated Biological Resources Constraints Memorandum Report for the Creekside Village Project

Introduction

This memorandum report provides an updated biological resource constraints analysis associated with the Creekside Village Project (project). Most of the biological resources constraints analyses were previously discussed in the November 2023 *Biological Resource Constraints Report* (2023 BRCR; ESA 2023). In addition to a handful of updates to the biological resource constraints, that reflect new information obtained from site surveys, this memorandum also provides an analysis and comparison of impacts between the Proposed Project alternative (which coincides with the alternative analysis in the 2023 BRCR), and a new project alternatives named the Reduced Impact Alternative. For each section in the 2023 BRCR, there will be a statement at the beginning identifying whether there was a change or update to the text in that section to reflect the most current data and discussions for their respective topics.

The study area for this report comprises the main residential development project site and offsite locations including a sewer force main alignment along Latrobe Road and intersection improvements located in the unincorporated community of El Dorado Hills in western El Dorado County, California (**Figure 1**). The purpose is to clarify the potential for special-status biological resources to occur on the project site as well as provide information on potential regulatory constraints associated with implementation of the proposed project and project alternatives to further avoid impacts to biological resources. This report is intended to supplement and update the 2023 BRCR.

This report identifies the existing biological resources at the project site; identifies the federal, state, and local regulations pertaining to biological resources within the region; and describes potential project impacts on those biological resources as well as mitigation measures to reduce project-related impacts. The information and

analysis presented in this report is focused on special-status species,[1] wildlife habitats, vegetation communities, and aquatic resources that may qualify as waters of the U.S. or state. The results of the assessment presented in this report are based upon literature review and queries of the California Department of Fish and Wildlife's (CDFW) Natural Diversity Database (CNDDB), the U.S. Fish and Wildlife Service's (USFWS) list of federal endangered and threatened species, and the California Native Plant Society's (CNPS) Inventory of Rare and Endangered Plants, as well as surveys conducted at the project site.

Biological resources within the project site were identified through field reconnaissance surveys conducted in August 2019, December 2020, January 2021, April 2022, and during protocol brachiopod surveys from January to June 2024. Updated database queries were completed in November 2024 and are attached to this report (**Attachment 1**).

Project Location

The project site is in southwestern El Dorado Hills in western El Dorado County, just east of the City of Folsom, California (**Figure 2**). The main project area is located south of the intersection of Latrobe Road and Investment Boulevard and is on the Folsom SE, California U.S. Geological Survey (USGS) 7.5-minute series quadrangle. The project includes the installation of a sewer force main within the alignment of Latrobe Road extending approximately 1.8 miles north of the main project site to the El Dorado Hills Wastewater Treatment Plant.

Data Sources/Methodology

There was an update to the data methodology for the large listed branchiopod surveys conducted in 2024 from the 2023 BRCR.

The 2023 BRCR, identified biological resources within the project site by ESA biologists Erich Fischer, Joshua Boldt, and Chuck Hughes through field reconnaissance surveys conducted on August 20, 2019, December 10, 2020, January 13, 2021, and April 19, 2022. In addition, from January to June 2024, wet and dry season surveys were conducted to evaluate the potential presence of special-status vernal pool species. The protocol-level branchiopod survey was conducted using two methodologies: in the wet season dipnet surveys were conducted, and a dry season, soil sampling surveys for large, listed branchiopods were conducted (ESA, 2024b).

In addition to the data sources/methodology described in the 2023 BRCR, database queries were updated to identify any changes. The primary updated sources include the following:

- USFWS list of federal endangered and threatened species that may occur in the proposed project location, and/or may be affected by the project (USFWS, 2024a) (see **Appendix A**);
- CNDDB (v 5.3.0) list of special-status species occurrences within the Folsom SE, California and eight surrounding USGS 7.5-minute topographic quadrangles (Folsom, Clarksville, Shingle Springs, Buffalo Creek, Latrobe, Sloughhouse, Carbondale, and Irish Hill) (CDFW, 2024a) (see Appendix A);
- CNPS Inventory of Rare and Endangered Plants (v9.5) known to occur within the Folsom SE, California and eight surrounding USGS 7.5-minute topographic quadrangles (CNPS, 2024) (see Appendix A);

[1] Species that are regulated pursuant to federal or state endangered species laws, or have been designated as Species of Special Concern by the CDFW, or species that are not included on any agency listing but meet the definition of rare, endangered or threatened species of the CEQA Guidelines section 15380(b), are collectively referred to as "special-status species".

Most of the information presented under aquatic resources remains the same as reported in the 2023 BRCR and is based on an aquatic resources delineation that was conducted for the project site by ESA in August 2019 and January 2021 (ESA, 2023). However, on September 30, 2024 the U.S. Army Corps of Engineers (USACE) identified specific data needs and requested specific revisions and additional information about certain aquatic resources. ESA biologist Chuck Hughes conducted a focused site visit on October 16, 2024, to collect additional data and site-specific information to help inform revisions and updates to the aquatic resources delineation report (ESA, 2024a).

Environmental Setting

There are no changes or updates to the environmental setting discussions from the 2023 BRCR. However, there are changes to the acreages of habitat types presented in Table 1, due to project alternative design changes and an updated aquatic resources delineation conducted by ESA in October 2024. Some habitat types will have fewer impacts while others will have more. In addition, the offsite areas include the areas along and adjacent to Latrobe Road as well as the area north of the project site associated with the emergency vehicle access road.

Figure 3 depicts the extent of wildlife habitats that occur within the project site and offsite areas. **Table 1** shows the habitat type acreages for the project site and offsite areas.

There are updates for the habitat type acreages from the 2023 BRCR.

TABLE 1
HABITAT TYPES (UPDATED)

Habitat Type	Project Area (acres)	Offsite Area (acres)[1]	Total Project and Offside Area (acres)
Annual Grassland	202.88	6.18	209.05
Blue Oak Woodland	0.45	–	0.45
Culvert (Riverine)	0.01	0.07	0.08
Developed/Disturbed	0.43	20.72	21.15
Ditch	0.01		0.01
Ephemeral Drainage (Riverine)	2.05	0.08	2.13
Intermittent Drainage (Riverine)	1.76	0.04	1.80
Perennial Drainage (Riverine)	–	0.30	0.30
Seasonal Wetland (including Seep, Wetland Swale, Riverine Seasonal Wetland, and Seasonal Wetland)	1.65	0.03	1.68
Valley Foothill Riparian	0.75	0.47	1.22
Vernal Pool	0.07	--	0.07
Total	**210.05**	**27.88**	**239.93**

NOTE: Total may not sum due to rounding.
SOURCE: ESA, 2023

[1] Offsite Area includes the corridor along Latrobe Road necessary for transportation intersection and sewer improvements as well as the emergency vehicle access road.

Terrestrial Habitats

There are no changes or updates for the terrestrial habitat discussions from the 2023 BRCR.

Aquatic Resources

As a result of the supplement aquatic resource surveys, there were some changes to aquatic resource feature types, and new features were delineated. For example, wetland swale features were reviewed in the field: two features were recharacterized as seep or riverine seasonal wetland because they were not linear features, but most wetland swales were recharacterized as ephemeral channels due to the presence of an ordinary high-water mark (OHWM) consistent with the Western Mountains, Valleys, and Coast Region OHWM Guide (USACE, 2014). Based on input from the USACE, in several locations' wetlands below the OHWM were incorporated into the acreage of the intermittent channel (ESA, 2024). As a result, revised aquatic resources extent within the project are and offsite areas are summarized in **Table 2** and are depicted in **Figure 4.** All aquatic resources, and extent of potentially jurisdictional boundaries, identified in this report are considered preliminary and are still pending verification from the appropriate regulatory agencies. It should be noted that the numbers presented in the Table 2 represent the same study area provided in Table 1.

TABLE 2
AQUATIC RESOURCES (UPDATED)

Habitat Type	Project Area (acres)	Offsite Area (acres)[1]	Total Project and Offside Area (acres)
Culvert (Riverine)	0.01	0.07	0.08
Ditch	0.01	–	0.01
Ephemeral Drainage (Riverine)	2.05	0.08	2.13
Intermittent Drainage (Riverine)	1.76	0.04	1.80
Perennial Drainage (Riverine)	--	0.30	0.30
Riparian Wetland	0.48	0.47	0.95
Seasonal Wetland (includes seep, seasonal wetland, and riverine seasonal wetland, and wetland swale)	1.65	0.03	1.68
Vernal Pool	0.07	--	0.07
Total	**6.02**	**0.99**	**7.00**

NOTE: Total may not sum due to rounding.

SOURCE: ESA, 2024a

[1] Offsite Area includes the corridor along Latrobe Road necessary for transportation intersection and sewer improvements as well as the emergency vehicle access road.

Sensitive Natural Community

There are no changes or updates for the sensitive natural community discussions from the 2023 BRCR.

Wildlife Movement Corridors

There are no changes or updates for the wildlife movement corridors discussions from the 2023 BRCR.

Special-Status Species

***Table 3**, which lists the regional special-status species and their potential to occur at the project site, has been updated to reflect additional information and survey results for some species.*

Updates to **Table 3** were made based on additional information and survey results for the following special-status species:

- **California tiger salamander** – after conducting a full season of dipnet surveys, no tiger salamander larvae were observed in any of the aquatic features. These surveys further support the revision of it potential to occur at the project site from unlikely to absent.

- **California red-legged frog** – upon surveying and further inspecting the drainage features at the project site, they do not provide sufficient depth during the wet season and are either extremely shallow or completely dry by late spring and summer. This lack of suitable aquatic habitat for the species justified the revision of its potential to occur at the project site from low to unlikely.

- **Western spadefoot** – no western spadefoot were observed during dipnet surveys of all the aquatic features. Thus, the potential to occur status for the species was revised from low to absent.

- **Tricolored blackbird** – added that it is present within the project site.

- **Great egret, great blue heron, and ferruginous hawk** – deleted these three species from the special-status species table because they are common bird species with only protections from the Migratory Bird Treaty Act.

- **Western burrowing owl** – reduced its potential to occur from high to moderate because during multiple years of surveys at the project site, no burrowing owl has ever been observed. The habitat present on site is still suitable for the species and thus its potential to occur remains moderate.

- **Vernal pool fairy shrimp and vernal pool tadpole shrimp** – wet season dipnet surveys and dry season soil sample surveys were conducted for both species. The survey results for both survey methodologies were negative. It is unlikely these species have any potential to occur at the project site, and its status was revised appropriately in Table 3.

- **Northwestern pond turtle** – the aquatic habitat is only marginally suitable for the species because it does not retain water throughout its nesting season from May to July. Also, no northwestern pond turtles have ever been observed at the project site during surveys. There is no appropriate aquatic habitat in the nearby vicinity, and it is unlikely the turtles will venture away from more suitable habitat to the project site. The species' potential to occur was reduced from medium to low.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/ CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Amphibians			
California tiger salamander *Ambystoma californiense*	FT/ST	Grassland, oak savanna, and edges of mixed woodland and lower elevation coniferous forest. Requires temporary breeding ponds to breed. Spends most time underground in animal burrows, especially those of California ground squirrels, valley pocket gophers, and moles. Requires both suitable upland terrestrial habitat with mammal burrows for refuge and temporary breeding ponds to survive and reproduce. Found in the Central Valley and adjacent Sierra Nevada foothills up to 1,500 feet. The Cosumnes River marks the northern boundary of the species' range, except for an isolated occurrence in the Dunnigan Hills in northern Yolo County.	**Absent.** Suitable habitat (seasonal wetlands, vernal pools, annual grassland) is present within the project site. However, the site is outside known species range; the project area is north of the Cosumnes River. Dipnet surveys were conducted in all the potential aquatic habitat features and none of them contained California tiger salamander larvae. There are no recorded observations of this species in the CNDDB within five miles.
Foothill yellow-legged frog *Rana boylii*	FE/SE	Partly shaded, shallow streams and riffles with a rocky substrate in a variety of habitats. Need at least some cobble-sized substrate for egg laying. Need at least 15 weeks to attain metamorphosis.	**Unlikely.** No suitable habitat is present for this species within the project site. There are no recorded observations of this species in the CNDDB within five miles.
California red-legged frog *Rana draytonii*	FT/SSC	Found mainly near ponds in humid forests, woodlands, grasslands, coastal scrub, and streamsides with plant cover. Most common in lowlands or foothills. Frequently found in woods adjacent to streams. Breeding habitat is in permanent or ephemeral water sources: lakes, ponds, reservoirs, slow streams, marshes, bogs, and swamps. Ephemeral wetland habitats require animal burrows or other moist refuges for estivation when the wetlands are dry. Found along the coast and coastal mountain ranges of California from Marin County to San Diego County and in the Sierra Nevada from Tehama County to Fresno County.	**Unlikely.** The drainages within the project site do not provide suitable habitat for this species because they are too shallow and dry up in late spring and summer. There are no recorded observations of this species in the CNDDB within five miles.
Western spadefoot *Spea hammondii*	FPT/SSC	Occurs primarily in grassland habitats, but can be found in valley-foothill hardwood woodlands. Vernal pools (typically in large complexes) are essential for breeding and egg-laying. Found in the Sierra Nevada foothills, Central Valley, Coast Ranges, and coastal counties in southern California.	**Absent.** Isolated marginal aquatic habitat (discontinuous seasonal wetlands, vernal pools) is sparse and broadly distributed across the project site. Suitable upland habitat (annual grasslands) is present within project site, but the low density of aquatic habitat reduces the likelihood for the species to occur. Dipnet surveys were conducted in all the potential aquatic habitat features and none of them contained spadefoot larvae. There are no recorded observations of this species in the CNDDB within five miles.
Birds			
Tricolored blackbird *Agelaius tricolor*	–/ST	Highly colonial, most numerous in Central Valley and vicinity. Nests in cattails, tules, and blackberries large enough for at least 50 nesting pairs, usually over water. Requires foraging area with insect prey within a few kilometers of the colony. Forages in grassland and cropland.	**High/Present.** There is a nesting colony at the project site in riparian wetland blackberry patches associated with an intermittent channel. There are numerous occurrences documented in the CNDDB to the south and west within five miles.
Grasshopper sparrow *Ammodramus savannarum*	--/SSC	Occurs in dry, dense grasslands, especially with scattered shrubs for sitting perches. A thick cover of grasses and tall forbs is essential for concealment. Nests are built of grasses and forbs in slight depressions in ground hidden by a clump of grasses or forbs. Loosely colonial when nesting.	**Moderate.** Grassland in the project site is kept grazed and relatively low in stature. There are relatively few shrubs present in the grassland. There are no recorded observations of this species in the CNDDB within five miles.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/ CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Golden eagle *Aquila chrysaetos*	–/FP	Cliffs and escarpments or tall trees for nesting; annual grasslands, chaparral, and oak woodlands with plentiful medium and large-sized mammals for prey. Foothills and mountains throughout California; uncommon nonbreeding visitor to lowlands such as the Central Valley.	**Low.** No nesting habitat is present within the project site. Could utilize annual grasslands for foraging. There are two recorded observations of this species in the CNDDB within five miles.
Western burrowing owl *Athene cunicularia*	–/SCE	Nests and forages in open, dry, annual or perennial grasslands and scrublands characterized by low-growing vegetation. Subterranean nester dependent upon burrowing mammals, especially California ground squirrel (*Otospermophilus beecheyi*) for burrows. May also be found around golf courses, and disturbed/ruderal habitat in urban areas. Forages in open plains, grasslands, and prairies.	**Moderate.** Suitable nesting and foraging habitat occurs in annual grasslands in the project site. However, despite regular and ongoing reconnaissance surveys of the project area, no burrowing owls have been observed. There are four recorded observations of this species in the CNDDB within five miles, and there is an additional recent observation immediately west in the Carson Creek Specific Plan Area.
Swainson's hawk *Buteo swainsoni*	–/ST	Breeds in grasslands with scattered trees, juniper-sage flats, riparian areas, savannahs, and agricultural or ranch lands with groves or lines of trees. Nests in oaks or cottonwoods in or near riparian habitats. Requires adjacent suitable foraging areas such as grasslands, alfalfa, or grain fields supporting rodent populations. Northern habitat summer range in California begins in central Tehama south to Kern County. Predominant breeding habitat is located in the Central Valley.	**Low.** No suitable nesting habitat is present on site; suitable foraging habitat is present within the annual grasslands. However, there are no recorded active nests within five miles of the project site. There are two recorded observations of this species in the CNDDB within five miles; however, both records are from 1992.
White-tailed kite *Elanus leucurus*	–/FP	Rolling foothills and valley margins with scattered oaks, and river bottomlands or marshes next to deciduous woodland. Open grasslands, meadows, or marshes for foraging close to isolated, dense-topped trees for nesting and perching.	**Moderate.** Suitable nest trees are present within the blue oak grove on site. Annual grassland in the project area provides foraging habitat for this species. There are three recorded observations of this species in the CNDDB within five miles.
Bald eagle *Haliaeetus leucocephalus*	–/SE,FP	Prefers oceans shores, lake margins, and rivers for both nesting and wintering. Most nests are within one mile of water. Nests in large, old-growth, or dominant live tree with open branches, especially ponderosa pine. Roosts communally in winter.	**Unlikely.** Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.
California black rail *Laterallus jamaicensis*	–/ST,FP	Found in salt, brackish, and freshwater marsh with dense vegetation for nesting habitat. Majority of population found in the tidal salt marshes of the northern San Francisco Bay region, primarily in San Pablo and Suisun Bays; also found in freshwater marshes in the foothills of the Sierra Nevada.	**Unlikely.** Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.
Bank swallow *Riparia riparia*	–/ST	Colonial nester; nests primarily in riparian and other lowland habitats west of the desert. Requires vertical banks/cliffs with fine-textured/sandy soils near streams, rivers, lakes, and ocean to dig nesting hole.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Fish			
Delta smelt *Hypomesus transpacificus*	FT/SE	Open surface waters in the Sacramento/San Joaquin Delta. Seasonally in Suisun Bay, Carquinez Strait and San Pablo Bay. Found in Delta estuaries with dense aquatic vegetation and low occurrence of predators. May be affected by downstream sedimentation.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/ CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Steelhead – Central Valley DPS *Oncorhynchus mykiss irideus* pop. 11	FT/--	This evolutionary significant unit (ESU) enters the Sacramento and San Joaquin Rivers and their tributaries from July to May; spawning occurs from December to April. Young move to rearing areas in and through the Sacramento and San Joaquin Rivers, Delta, and San Pablo and San Francisco Bays. Needs cool water with moderate size gravel for spawning and cover for rearing.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Invertebrates			
Vernal pool fairy shrimp *Branchinecta lynchi*	FT/--	Endemic to the grasslands of the Central Valley, central coast mountains, and south coast mountains, in astatic rain-filled pools. Inhabit small, clear-water sandstone-depression pools and grassed swale, earth slump, or basalt-flow depression pools.	**Absent.** Wet season dipnet surveys and dry season soil sampling surveys were conducted at potentially suitable aquatic habitat features. The survey results were negative. Although there are three recorded observations of this species in the CNDDB within five miles, it is unlikely this species occurs in the project site.
Crotch bumble bee *Bombus crotchii*	--/SCE	Inhabits grassland and scrub areas, requiring a hotter and drier environment than other bumblebee species and nests underground, often in abandoned rodent dens. The historic range includes much of southern California, the San Joaquin Valley, central coast range, Bay Area, and more limited areas elsewhere in northern California (The Xerces Society 2018).	**Unlikely.** The grassland may provide suitable habitat, but the site is outside the current range and there are no records in El Dorado County despite a relatively high sampling effort (The Xerces Society 2018). There are no recorded observations of this species in the CNDDB within five miles
Monarch butterfly *Danaus plexippus*	FC/--	Overwintering trees occur near the coast. Larvae feed on milkweed plants (*Asclepias* sp.) elsewhere.	**Low.** Narrow leaf milkweed plants were observed on the project site, but in low abundance. The project site provides limited habitat but is outside of known winter aggregation sites.
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	FT/--	Occurs only in the Central Valley of California, in association with blue elderberry (*Sambucus nigra* subsp. *caerulea*). Prefers to lay eggs in elderberries 2-8 inches in diameter; some preference shown for "stressed" elderberries.	**Unlikely.** No suitable habitat is present for this species within the project area. No elderberry shrubs were noted within the site during biological surveys conducted for the project. There are no recorded observations of this species in the CNDDB within five miles.
Vernal pool tadpole shrimp *Lepidurus packardi*	FE/--	Inhabits vernal pools and swales in the Sacramento Valley containing clear to highly turbid water. Pools commonly found in grass bottomed swales of unplowed grasslands. Some pools are mud-bottomed and highly turbid.	**Absent.** Wet season dipnet surveys and dry season soil sampling surveys were conducted at potentially suitable aquatic habitat features. The survey results were negative. Although there are five recorded observations of this species in the CNDDB within five miles, it is unlikely this species occurs in the project site.
Mammals			
Pallid bat *Antrozous pallidus*	--/SSC	Deserts, grasslands, shrublands, woodlands, and forests. Most common in open, dry habitats with rocky outcroppings for roosting, particularly near water. Roosts in rock crevices, buildings, and under bridges. Roosts must protect bats from elevated temperatures. Sensitive to disturbance of roosting sites.	**Low.** No suitable roosting habitat is present in the project site; however, suitable foraging habitat is present in the annual grasslands. There are no recorded observations of this species in the CNDDB within five miles.
Fisher – West Coast DPS *Pekania pennanti*	--/SSC	Intermediate to large-tree stages of coniferous forests and deciduous-riparian areas with high canopy closure. Uses cavities, snags, logs, and rocky areas for cover and denning. Needs large areas of mature, dense forest.	**Unlikely.** Suitable habitat is not present within the project site.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/ CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
American badger *Taxidea taxus*	–/SSC	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats, with friable soils. Needs sufficient food, friable soils, and open, uncultivated ground. Preys on burrowing rodents. Digs burrows.	**Low.** Suitable burrowing and foraging habitat occurs in annual grasslands in the project site; however, no burrows that could be utilized by this species were present. There are no recorded observations of this species in the CNDDB within five miles.
Reptiles			
Northwestern pond turtle *Actinemys marmorata*	FPT/SSC	A thoroughly aquatic turtle of ponds, marshes, rivers, streams, and irrigation ditches, usually with aquatic vegetation, below 6,000 feet elevation. Need basking sites and suitable (sandy banks or grassy open fields) upland habitat up to 0.5 kilometer from water for egg-laying. Populations extend throughout the coast and Central Valley of CA.	**Low.** Marginally suitable aquatic habitat is present in the intermittent stream. The intermittent stream only has water in it during the winter and spring and substantial portions of it dries up in the hot summer months. Potential nesting habitat is present in adjacent uplands within the project site. However, with the lack of suitable aquatic habitat during the nesting window from May to July, nesting in the project site is unlikely. No turtles have been observed at the project site during surveys. There are four recorded observations of this species in the CNDDB within five miles.
Coast horned lizard *Phrynosoma blainvillii*	–/SSC	Frequents a wide variety of habitats; however, most common in lowlands along sandy washes with scattered low bushes. Inhabits open areas of sandy soil and low vegetation in valleys, foothills and semiarid mountains. Found in grasslands, coniferous forests, woodlands, and chaparral, with open areas and patches of loose soil. Needs open areas for sunning, bushes for cover, patches of loose soil for burial, and abundant supply of native ants.	**Unlikely.** Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.
Giant gartersnake *Thamnophis gigas*	FT/ST	Prefers freshwater marsh and low gradient streams. Has adapted to sloughs, canals, and other small waterways where there is a prey base of small fish and amphibians. Requires grassy banks and emergent vegetation for basking and areas of high ground protected from flooding during winter. Utilizes upland habitats within 200 feet from aquatic habitats. This is the most aquatic of the garter snakes in California. Occurs in the Central Valley from Fresno County north to the Gridley/Sutter Buttes area; has been extirpated from areas south of Fresno.	**Unlikely.** Suitable habitat is not present within the project site. The project site is outside the range. There are no recorded observations of this species in the CNDDB within five miles.
Plants			
Jepson's onion *Allium jepsonii*	–/–/1B.2	Open, serpentine or volcanic slopes, flats. Blooms April- August. Elevation 300-600m.	**Unlikely.** Suitable habitat is not present within the project site. Site is outside elevation range of species. There are no recorded observations of this species in the CNDDB within five miles.
Ione manzanita *Arctostaphylos myrtifolia*	FT/--/1B.2	Acidic sandy or clay soils, chaparral, woodland. Blooms January – February. Elevation 70-770m.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Stebbin's morning-glory *Calystegia stebbinsii*	FE/SE/1B.1	Chaparral. Blooms April – June. Elevation 185-1,090m.	**Unlikely.** Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/ CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Chaparral sedge *Carex xerophila*	–/–/1B.2	Dry gabbro or serpentine soils in open forest, scrub, thicket edges, chaparral. Fruits March – June. Elevation 450-770m.	**Unlikely.** Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.
Pine Hill ceanothus *Ceanothus roderickii*	FE/SR/1B.1	Rocky, gabbro-derived substrates, chaparral, oak/pine woodland. Blooms March – June. Elevation 260-630m.	**Unlikely.** Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.
Red Hills soaproot *Chlorogalum grandiflorum*	--/--/1B.2	Serpentine or gabbro outcrops, open shrubby or wooded hills. Blooms May – June. Elevation 300-500m.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Bisbee Peak rush rose *Crocanthemum suffrutescens*	–/–/3.2	Shallow soils on Ione formations within in chaparral. Blooms April – June. Elevation 100-700m.	**Unlikely.** Suitable habitat is not present within the project site. There are three recorded observations of this species in the CNDDB within five miles.
Dwarf downingia *Downingia pusilla*	--/--/2B.2	Vernal pools, roadside ditches. Blooms March – May. Elevation up to 150m.	**Moderate.** Suitable habitat present in the vernal pools and some seasonal wetlands present in the project site. There are no recorded observations of this species in the CNDDB within five miles.
Starved daisy *Erigeron miser*	--/--/1B.3	Rocky sites. Blooms July – October. Elevation 1,900-2,300m.	**Unlikely.** Suitable habitat is not present within the project site. Site is outside elevation range of species. There is one recorded observation of this species in the CNDDB within five miles.
Ione buckwheat *Eriogonum apricum* var. *apricum*	FE/SE/1B.1	Clay soils on Ione formations. Blooms June – October. Elevation 80-200m.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Irish Hill buckwheat *Eriogonum apricum* var. *prostratum*	FE/SE/1B.1	Clay soils on Ione formations. Blooms June – July. Elevation 90-120m.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Tuolumne button-celery *Eryngium pinnatisectum*	–/–/1B.2	Vernal pools, swales, intermittent streams. Blooms May – August. Elevation 70-950m.	**Moderate.** Suitable habitat present in the vernal pools, seasonal wetlands, swales and intermittent streams present in the project site. There are no recorded observations of this species in the CNDDB within five miles.
Pine Hill flannelbush *Fremontodendron decumbens*	FE/SR/1B.2	Gabbro outcrops in chaparral or pine woodland. Blooms April – July. Elevation 425-7 60m.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
El Dorado bedstraw *Galium californicum* subsp. *sierrae*	FE/SR/1B.2	Oak pine, oak forests, chaparral. Blooms March – July. Elevation 100-500m.	**Unlikely.** Suitable habitat is not present within the project site. There is one recorded observation of this species in the CNDDB within five miles.
Boggs Lake hedge-hyssop *Gratiola heterosepala*	--/SE/1B.2	Shallow water, margins of vernal pools. Blooms April – September. Elevation up to 1,600m.	**Moderate.** Suitable habitat present in the vernal pools and some seasonal wetlands present in the project site. There is one recorded observation of this species in the CNDDB within five miles.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/ CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site
Parry's horkelia *Horkelia parryi*	–/–/1B.2	Chaparral or woodland. Blooms April – September. Elevation 80-1,070m.	**Unlikely.** Suitable habitat is not present within the project site. There are no recorded observations of this species in the CNDDB within five miles.
Ahart's dwarf rush *Juncus leiospermus* var. *ahartii*	–/–/1B.2	Vernal pool margins, grassland swales, and gopher mounds. Fruits March – May. Elevation 30-90m.	**Moderate.** Suitable habitat present in the vernal pools, seasonal wetlands, and swales present in the project site. There are no recorded observations of this species in the CNDDB within five miles.
Legenere *Legenere limosa*	–/–/1B.1	Wet areas, vernal pools, ponds. Blooms March – June. Elevation up to 950m.	**Moderate.** Suitable habitat present in the vernal pools and some seasonal wetlands present in the project site. There is one recorded observation of this species in the CNDDB within five miles.
Pincushion navarretia *Navarretia myersii* subsp. *myersii*	–/–/1B.1	Vernal pools. Blooms April – May. Elevation 20-90m.	**Moderate.** Suitable habitat present in the vernal pools and some seasonal wetlands present in the project site. There are no recorded observations of this species in the CNDDB within five miles.
Slender Orcutt grass *Orcuttia tenuis*	FT/SE/1B.1	Vernal pools, often gravelly soils. Species requires prolonged inundation period. Species known from larger pools (>0.2 acre). Blooms May – October. Elevation 36-1,760m.	**Unlikely.** Although the project site supports vernal pool habitat, the vernal pools in the site are not large enough nor do they remain inundated long enough to support this species. There are no recorded observations of this species in the CNDDB within five miles.
Sacramento Orcutt grass *Orcuttia viscida*	FE/SE/1B.1	Vernal pools. Species requires prolonged inundation period. Species known from larger pools (>0.1 acre). Blooms April – July. Elevation up to 100m.	**Unlikely.** Although the project site supports vernal pool habitat, the vernal pools in the site are not large enough nor do they remain inundated long enough to support this species. There are no recorded observations of this species in the CNDDB within five miles.
Layne's ragwort *Packera layneae*	FT/SR/1B.2	Serpentine or gabbroic soils within openings in chaparral or woodlands. Blooms April – August. Elevation 200-1,085m.	**Unlikely.** Suitable habitat is not present within the project site. There are three recorded observations of this species in the CNDDB within five miles.
Sanford's arrowhead *Sagittaria sanfordii*	–/–/1B.2	Ponds, ditches. Blooms May – November. Elevation up to 300m.	**Low.** Most of the aquatic habitats do not inundate long enough to support this species. There is limited habitat in some of the aquatic habitats that receive warm-season irrigation runoff from nearby development. There is one recorded observation of this species in the CNDDB within five miles, but most records are in the Central Valley and not the foothills.
El Dorado County mule ears *Wyethia reticulata*	–/–/1B.2	Wooded slopes, chaparral, coniferous forest, clay or gabbroic soils. Blooms April – August. Elevation 150-630m.	**Unlikely.** Suitable habitat is not present within the project site. There are two recorded observations of this species in the CNDDB within five miles.

TABLE 3
REGIONAL SPECIAL-STATUS SPECIES

Common Name *Scientific Name*	Listing Status USFWS/ CDFW/ CNPS	General Habitat Requirements	Potential for Species Occurrence at the Project Site

STATUS CODES:

FEDERAL (U.S. Fish and Wildlife Service):

FE = Listed as Endangered by the Federal Government
FT = Listed as Threatened by the Federal Government
FPT = Federally proposed as Threatened
FC = Candidate for Federal Listing
MBTA = Migratory Bird Treaty Act (used when other designations absent)

STATE (California Department of Fish and Wildlife):

SE = Listed as Endangered by the State of California
ST = Listed as Threatened by the State of California
SCE = Candidate for state Listing
SSC = California species of special concern
CFP = California fully protected bird species

California Native Plant Society (CNPS):

Rank 1A = Plants presumed extirpated in California and either rare or extinct elsewhere
Rank 1B = Plants rare, threatened, or endangered in California and elsewhere
Rank 2A = Plants presumed extirpated in California but common elsewhere
Rank 2B = Plants rare, threatened, or endangered in California but more common elsewhere
Rank 3 = Plants about which more information is needed
Rank 4 = Plants of limited distribution

CNPS Code Extensions
.1 = Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
.2 = Fairly threatened in California (20-80% occurrences threatened)
.3 = Not very threatened in California (less than 20% of occurrences threatened or no current threats known)

Regulatory Framework

There are no updates to the regulatory framework from the 2023 BRCR.

Impacts and Mitigation Measures

Significance Criteria

There are no updates to the significance criteria from the 2023 BRCR.

Impact Assessment Methodology

There are no updates to the impact assessment methodology from the 2023 BRCR; however, it should be noted that the updates in the subsequent sections of this memorandum provide a comparison of potential impacts based on the two project alternatives. The revised tables provide for a side-by-side comparison of Proposed Project and the Reduced Impact Alternative impacts. The Proposed Project design included impacts to several biological resources.

Impact Analysis

There are updates to the acreages for habitat impacts from the 2023 BRCR.

Habitat impacts for the two project alternatives are identified in **Table 4**. The impacts on habitats associated with the Proposed Project and Reduced Impact Alternatives are depicted in **Figure 5** and **Figure 6**, respectively. All

the offsite impacts will be in Latrobe Road or adjacent developed/disturbed areas, and those acreage impacts are included in the table below. The impacts for the Proposed Project Area and Reduced Impact Alternative Area include impacts associated with the emergency vehicle access road.

TABLE 4
HABITAT IMPACTS

Habitat Type	Proposed Project Area (acres)[1, 2]	Reduced Impact Alternative Area (acres)[1, 2]
Annual Grassland	180.78	193.86
Blue Oak Woodland	0.20	0.39
Culvert	<0.01	<0.01
Developed/Disturbed	0.54	0.38
Ditch	--	0.014
Ephemeral Drainage (Riverine)	1.91	1.98
Intermittent Drainage (Riverine)	0.67	0.75
Seasonal Wetland[3]	1.33	1.45
Valley Foothill Riparian	0.10	0.54
Vernal Pool	0.07	0.07
Total Impacts[4]	**185.59**	**199.42**

SOURCE: ESA, 2024.

[1] The Proposed Project Area and Reduced Impact Alternative Area includes Project Area impacts related to disturbance and development of the emergency vehicle access road.
[2] Impact acreages to the offsite areas along Latrobe Road and for transportation intersection and sewer improvements are limited to developed/disturbed land covers within the existing roadways and the roadway rights-of-way and are not included in this table.
[3] Seasonal wetland includes seeps, riverine seasonal wetland, and seasonal wetland features.
[4] Totals may not sum due to rounding.

Impact Discussion

a) **Would the project have a substantial adverse effect, either directly or through habitat modification, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of fish and Wildlife or U.S. Fish and Wildlife Service?**

There are updates to the impact discussion on tricolored blackbird, western burrowing owl, northwestern pond turtle, vernal pool tadpole shrimp, and vernal pool fairy shrimp from the 2023 BRCR. Some of these changes may only apply to the Reduce Impact Alternative, while other changes are reflective of both alternatives and universally applicable to the entire site. Updates in this section are focused on the following species:

- *Vernal pool fairy shrimp*
- *Vernal pool tadpole shrimp*
- *Tricolored blackbird*

- *Western burrowing owl*
- *Northwestern pond turtle*

Less than Significant with Mitigation Incorporated. Special-status species and their habitats that may be affected either directly or indirectly through implementation of the alternatives. Each of these potentially affected species is described below.

Vernal Pool Fairy Shrimp and Vernal Pool Tadpole Shrimp

Vernal pools and some seasonal wetlands in the project site may provide suitable habitat for the federally listed vernal pool fairy shrimp and vernal pool tadpole shrimp. Most of the waters and wetlands on the project site are not habitat for listed branchiopods because they are either riverine, flow-through channels, or sloped wetlands that do not pond water. A field visit on December 10, 2020 identified potential habitat for listed branchiopods in select aquatic resource features. Other small seasonal wetlands, and one vernal pool (VP-2), were determined based on topography and vegetation to be too infrequently, if ever, inundated to support listed branchiopods. In coordination with the USFWS, ESA biologists completed protocol level surveys of all the potentially suitable aquatic habitat for listed branchiopods (ESA, 2024b).

No vernal pool fairy shrimp nor other fairy shrimp species were observed in any of the aquatic features that retained sufficient water for dipnet surveys.

Dry season soil sampling was also completed in early summer 2024. The soil sample analysis was completed per the USFWS protocol and no fairy shrimp eggs were observed in any of the soil samples. Based on these results, it is unlikely that vernal pool fairy shrimp and vernal pool tadpole shrimp occur in the project site and the project will not adversely affect any branchiopod individuals (ESA, 2024b).

Given the negative results from the wet and dry season surveys for large, listed branchiopods, it was determined that vernal pool fairy shrimp and vernal pool tadpole shrimp are unlikely to occur at the project site. Thus, it was determined there would be a **less than significant** impact on vernal pool fairy shrimp and vernal pool tadpole shrimp.

Special-Status Birds and Common Nesting Migratory Birds and Raptors

The project site and adjacent areas provide suitable habitats for nesting birds, including, but not limited to, special-status species such as tricolored blackbird, grasshopper sparrow, western burrowing owl, and white-tailed kite, as well as more common migratory birds and raptors.

Tricolored Blackbird

The Proposed Project would remove blackberry shrubs located along a riparian wetland corridor known to support tricolored blackbirds nesting colony. ESA conducted a site visit on April 19, 2022 to determine the current status of the tricolored blackbird nesting colony. The nesting colony reported in CNDDB was observed in clusters of Himalayan blackberry in riparian wetlands during the survey. The tricolored blackbird nesting colony was observed again incidentally during the wet season fairy shrimp dipnet surveys in 2024. This nesting colony likely returns to these blackberry thickets most years because it continues to have successful nests.

Both the Proposed Project and the Reduced Impact Alternative would have direct impacts on a portion of tricolored blackbird nesting habitat (e.g., blackberry thicket associated with Riparian Wetland [RW] 11). Impacts associated with the Proposed Project and Reduce Impact Alternative would be similar in location and magnitude.

For the portion of the nesting habitat that would be remain after construction, human disturbances and noise from construction activities have the potential to cause colony abandonment and death of young or loss of reproductive success during nesting season. Nesting birds could be adversely affected if the colony is exposed to a substantial increase in noise or human presence during project construction and operation.

Under both the Proposed Project and Reduced Impact Alternative, potential impacts on tricolored blackbird would be considered a **potentially significant** impact. Both the Proposed Project and Reduced Impact Alternative would implement **Mitigation Measures BIO-2a, BIO-4, BIO-5,** and **BIO-6,** to reduce impacts on tricolored blackbirds to **less than significant**.

Western Burrowing Owl and Grasshopper Sparrow

The grasshopper sparrow is a California species of special concern. The western burrowing owl is a candidate endangered species for listing under the CESA after the California Fish and Game Commission accepted a petition to list it on October 10, 2024.

Suitable annual grassland habitat for these species is present within the project site; however, no burrowing owls or grasshopper sparrows or active nests were observed during the biological surveys. Some soils within the project site are sandy and friable, which could provide suitable burrowing sites. However, there was no California ground squirrel (*Otospermophilus beecheyi*) activity observed within the project site and there were few alternative burrow features observed during the surveys. While no soil mounds were visible during the field survey, surrounding fence posts would provide suitable perches above potential nests within the annual grassland habitat. The annual grassland habitat also provides suitable foraging habitat for these species.

The proposed project could also result in a permanent loss of foraging opportunities for these species under either alternative. The loss of foraging habitat in the project site is not expected to significantly impact these species because these habitats are abundant in the vicinity.

Because the western burrowing owl is a candidate under CESA, if the species is present, and could be impacted by either alternative, then an incidental take permit may be required under CESA. CDFW may require compensatory mitigation, to meet the "fully mitigated" standard (CA Fish and Game Code §2081(b)(2)), a threshold higher than CEQA requirements.

Accordingly, under either alternative could potentially impact individual burrowing owls or grasshopper sparrows if they occupied the project site prior to construction. Indirect impacts to nesting birds during construction could extend up to 500 feet from the limits of construction. Potential impacts could include abandonment of nest sites and the mortality of young. This would be considered a **potentially significant** impact. With the implementation of **Mitigation Measures BIO-2a, BIO-2b, BIO-5,** and **BIO-6,** the project's impact to western burrowing owl and grasshopper sparrow would be considered **less than significant**.

Northwestern Pond Turtle

Four CNDDB occurrences occur within five miles of the project site, with the nearest two occurrences(#1316 and 468) respectively from observations in 2016 in Carson Creek 0.5 mile west of the project and 1988 from Deer Creek where it crosses Latrobe Road 0.9 mile southeast of the project site. Potentially suitable aquatic habitat for northwestern pond turtle was determined to occur on the project site within the intermittent drainage when inundated and the annual grasslands near the drainage may provide suitable upland nesting habitat. However, it is unlikely that northwestern pond turtles would occur in intermittent drainage feature and adjacent uplands within 0.25-mile (1,320 feet) because of insufficient water in the drainage feature year-round. To date this species has not been observed within this marginally suitable habitat during numerous survey efforts, including aquatic resource delineation and protocol-level branchiopod surveys. The drainage feature only has sufficient water during the winter and spring and it is typically dry by late spring. Also, the intermittent drainage is narrow (3-5 feet wide at the most), is densely vegetated throughout most of it, and has incised steep banks. Since the aquatic feature is mostly unsuitable habitat for northwestern pond turtle, it is unlikely any individuals would move upstream from the larger creek to the west into the project site. Also, there is no substantial open water upstream from where they may originate.

Given the marginally suitable aquatic habitat present, both alternatives have low potential to directly impact northwestern pond turtle. If present, northwestern pond turtle individuals could be harmed during placement of fill and grading activities during construction, which could crush individuals or occupied nests. Further reduction in habitat quantity and quality could result from hydrological alterations related to culvert or bridge installation, grading, or through construction of impervious surfaces, which could prevent adults from utilizing the affected habitats for nesting. Reduction in water quality could also occur from the creation of exposed areas of bare soil. This would be considered a **potentially significant** impact. With the implementation of **Mitigation Measures BIO-3** and **BIO-5** through **BIO-7**, the project's impact to northwestern pond turtle would be considered **less than significant.**

b) **Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?**

There are no updates or revisions to the 2023 BRCR. The Reduced Impact Alternative has the same impacts on sensitive natural communities as the Proposed Project and would require the same mitigation measures. As described in Table 4, there are minor differences in the acreage of impacts on riparian habitat.

c) **Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?**

Table 5 provides an update to the acreages of impact on state or federally protected wetlands associated with the Proposed Project and Reduced Impact Alternative. These changes are due, in part, to the revised aquatic resource delineation and input from the USACE.

Less than Significant with Mitigation Incorporated. The project site supports wetlands and other waters that may be subject to USACE jurisdiction under Section 404 of the CWA and/or regulation under the Porter-Cologne Act, California Fish and Game Code Section 1600 et seq. and the State Wetland Dredge and Fill Policy.

Development of the Proposed Project and Reduced Impact Alternative would result in the loss of potentially jurisdictional wetlands and other waters of the U.S. or State protected waters/wetlands as summarized in **Table 5**.

These features would be directly affected through grading and placement of fill. The loss of wetlands and other waters of the U.S. or State protected waters/wetlands is considered **potentially significant** impact. With the implementation of **Mitigation Measures BIO-4** through **BIO-7,** the project's impact to state or federally protect wetlands would be considered **less than significant**.

TABLE 5
SUMMARY OF IMPACTS TO AQUATIC RESOURCES

Aquatic Resource	Proposed Project Acres[1, 2]	Reduced Impact Alternative Acres[1, 2]
Culvert	0.003	0.004
Ditch	--	0.014
Ephemeral Drainage	1.906	1.978
Intermittent Drainage	0.671	0.753
Riparian Wetland	0.097	0.479
Riverine Seasonal Wetland	0.165	0.165
Seasonal Wetland	0.016	0.110
Seep	1.151	1.173
Vernal Pool	0.063	0.065
Wetland Swale	–	–
Totals[3]	**4.069**	**4.741**

SOURCE: ESA, 2024.

[1] The Proposed Project Area and Reduced Impact Alternative Area includes Project Area impacts related to disturbance and development of the emergency vehicle access road.
[2] Impact acreages to the offsite areas along Latrobe Road and for transportation intersection and sewer improvements are limited to developed/disturbed land covers within the existing roadways and the roadway rights-of-way and are not included in this table.
[3] Totals may not sum due to rounding

d) **Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?**

Most of the information presented in the 2023 BRCR remains the same. The Reduced Impact Alternative would have similar impacts on tricolored blackbird nesting habitat, a wildlife nursery site, as the Proposed Project.

As discussed above, there is a nesting colony of tricolored blackbirds on the project site. This colony is considered a native wildlife nursery site. Implementation of the Proposed Project and Reduced Impact Alternative would result in the removal of, or disturbance to the nursey site, and would be considered a **potentially significant** impact.

Both the Proposed Project and the Reduced Impact Alternative would remove a portion of tricolored blackbird nursery site (e.g., blackberry thicket associated with Riparian Wetland [RW] 11). Removal of habitat, human disturbances, and noise from construction and operation activities have the potential to cause adverse affects on the nursery site and could lead to colony abandonment and death of young or loss of reproductive success during nesting season.. This would be considered a **potentially significant** impact. With the implementation of **Mitigation Measures BIO-2a, BIO-4, BIO-5**, and **BIO-6,** the Proposed Project and Reduced Impact Alternative 's impact to native nursery sites would be considered **less than significant**.

e) **Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?**

The Reduced Impact Alternative would impact additional blue oak woodland compared to the Proposed Project .

Less than Significant. The refined boundary of blue oak woodland is approximately 0.45 acre in size and is regulated under the El Dorado County Oak Resources Conservation Ordinance (County Code §130.39). Under the Proposed Project, grading would remove approximately 0.20 acre of the blue oak woodland. In comparison, the Reduce Impact Alternative would remove approximately 0.39 acres of blue oak woodland. The County ordinance requires mitigation at a 1:1 ratio for projects that remove less than 50% of on-site oak woodland. Mitigation may be in the form of an in-lieu fee to the County (used to conserve oak woodland in high priority areas of the County pursuant to the El Dorado County [2017] Oak Resources Management Plan), offsite conservation, replacement planting, or a combination of those methods. The mitigation is included as part of a development application and approved by the County as part of the review process. Both alternatives would remove oak woodland, but would not conflict with the local ordinance because mitigation would be required as part of the local approval process. Therefore, neither alternative would conflict with any other local policies or ordinances protecting biological resources.

f) **Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?**

Neither the Proposed Project nor the Reduced Impact Alternative would conflict with an adopted Habitat Conservation, Natural Community Conservation or other approved local, regional or state habitat conservation plan.

Mitigation Measures

Some mitigation measures were revised or updated from the biological resources constraints report submitted in 2023. Mitigation Measure BIO-1 was deleted because after conducting wet and dry season surveys for large,

listed branchiopods, it was determined the project would have no impacts on these vernal pool species. The compensatory mitigation for loss of wetlands and other waters of the US is covered in BIO-4.

Mitigation Measure BIO-1: Compensate for the Loss of Habitat for Vernal Pool Species.

This mitigation measure should be removed and is no longer applicable since protocol surveys for these species were negative (ESA, 2024b). Neither the Proposed Project, nor the Reduced Impact Alternative would result in significant impacts on this species and thus no mitigation would be required.

Mitigation Measure BIO-2a: Perform Pre-Construction Surveys for Nesting Special-Status and Common Migratory Birds.

There are no proposed changes to this Mitigation Measure.

Mitigation Measure BIO-2b: Perform Pre-Construction Surveys for Burrowing Owl

There are no proposed changes to this Mitigation Measure. However, it should be noted that due to the recent State Candidate listing status of the species, if western burrowing owls are found in or near the alternative an Incidental Take Permit from CDFW may be required.

Mitigation Measure BIO-3: Perform Pre-Construction Surveys for Northwestern Pond Turtle and Monitoring of In-water Work

There are no proposed changes to this Mitigation Measure. However, it should be noted that relocation of northwestern pond turtles could only be conducted with the expressed consent and incidental take authorization by the USFWS.

Mitigation Measure BIO-4: Compensatory Mitigation for Loss of Regulated Resources

Revisions to this measure are proposed to provide greater flexibility in applying compensatory mitigation to all potential regulated resources, not just aquatic resources.

The project proponent shall demonstrate that there is no net loss of wetlands and other waters of the United States or state and other regulated resources including USFWS or CDFW listed wildlife. The project proponent shall develop a compensatory mitigation plan as a part of the permitting process. Compensatory mitigation shall be implemented provided prior to construction-related impacts to the existing waters/wetlands and protected species. The exact mitigation ratio would be determined in consultation with the applicable permitting agencies, which may include USACE, CDFW, and/or RWQCB. The amount of mitigation will be based on the type and value of the resource affected by the project, and will be determined in consultation with the USACE and/or RWQCB, and/or CDFW during the regulatory permitting process. Compensation shall take the form of preservation, restoration, enhancement, or creation in accordance with USACE and/or RWQCB and/or CDFW mitigation requirements, as required under project permits. Compensatory mitigation obligations may be satisfied through the purchase of credits from an agency-approved mitigation bank, contribution to an established in-lieu fee program, or through permittee responsible mitigation.

Mitigation Measure BIO-5: Conduct Environmental Awareness Training

There are no proposed changes to this Mitigation Measure.

Mitigation Measure BIO-6: Install Temporary Barrier Fencing, and/or Flagging to Protect Environmentally Sensitive Habitat Areas

There are no proposed changes to this Mitigation Measure.

Mitigation Measure BIO-7: Implement Best Management Practices to Protect Water Quality

There are no proposed changes to this Mitigation Measure.

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)

(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

https://www.fws.gov/sites/default/files/documents/endangered-species-consultation-handbook.pdf

Migratory Birds: In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts, see https://www.fws.gov/program/migratory-bird-permit/what-we-do.

The MBTA has no provision for allowing take of migratory birds that may be unintentionally killed or injured by otherwise lawful activities. It is the responsibility of the project proponent to comply with these Acts by identifying potential impacts to migratory birds and eagles within applicable NEPA documents (when there is a federal nexus) or a Bird/Eagle Conservation Plan (when there is no federal nexus). Proponents should implement conservation measures to avoid or minimize the production of project-related stressors or minimize the exposure of birds and their resources to the project-related stressors. For more information on avian stressors and recommended conservation measures, see https://www.fws.gov/library/collections/threats-birds.

In addition to MBTA and BGEPA, Executive Order 13186: *Responsibilities of Federal Agencies to Protect Migratory Birds*, obligates all Federal agencies that engage in or authorize activities that might affect migratory birds, to minimize those effects and encourage conservation measures that will improve bird populations. Executive Order 13186 provides for the protection of both migratory birds and migratory bird habitat. For information regarding the implementation of Executive Order 13186, please visit https://www.fws.gov/partner/council-conservation-migratory-birds.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Code in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

- Official Species List

OFFICIAL SPECIES LIST

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

Sacramento Fish And Wildlife Office

PROJECT SUMMARY

Project Code: 2025-0020559
Project Name: Creekside Village
Project Type: Residential Construction
Project Description: Creekside Village is a development project in southwestern El Dorado Hills in western El Dorado County, just east of the City of Folsom. The project area is approximately 210-acres and construction is proposed to begin around 2026. The project's design has been modified from its original design to avoid and minimize impacts to sensitive biological resources.

Project Location:

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@38.61388595,-121.0505398119451,14z

Counties: El Dorado County, California

ENDANGERED SPECIES ACT SPECIES

There is a total of 8 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

OUR COMMITMENT TO SUSTAINABILITY | ESA helps a variety of public and private sector clients plan and prepare for climate change and emerging regulations that limit GHG emissions. ESA is a registered assessor with the California Climate Action Registry, a Climate Leader, and founding reporter for the Climate Registry. ESA is also a corporate member of the U.S. Green Building Council and the Business Council on Climate Change (BC3). Internally, ESA has adopted a Sustainability Vision and Policy Statement and a plan to reduce waste and energy within our operations. This document was produced using recycled paper.

CHAPTER 1
Introduction

This Aquatic Resources Delineation report (report) has been prepared to document the results and conclusions of an aquatic resources delineation and field survey conducted in August 2019 and January 2021 for Creekside Village Project (project). On behalf of Winn Communities, Environmental Science Associates (ESA) investigated the extent of aquatic resources within the project study area that may be subject to Federal regulation under Section 404 of the Clean Water Act (CWA) as well as state of California regulations under the Porter-Cologne Water Quality Control Act, State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (State Wetlands Procedures), and California Fish and Game Code (FGC) Section 1600. The purpose of this report is to (1) identify features within the project study area (i.e., areas that could be directly affected by construction of the project) that may be regulated under federal or state laws and regulations and (2) provide necessary background information to support required permit applications under said regulations.

The aquatic resource delineation process involves determining the boundaries between wetlands, waters, and surrounding uplands through the investigation of the three parameters that define a wetland: vegetation, soils, and hydrology, as well as those parameters that define non-wetland waters (other waters). This delineation is based on the best professional judgment of ESA investigators. All aquatic resources and the extent of boundaries identified in this report are considered preliminary, pending verification from the appropriate regulatory agencies.

1.1 Survey Location

The approximately 271.81-acre study area is located south of the unincorporated community of El Dorado Hills in in western El Dorado County, just east of the City of Folsom, California (**Figures 1** through **3**). The study area for this report comprises the main project footprint (234.43 acres) and offsite locations (37.38 acres) including the sewer force main alignment along Latrobe Road, and three offsite intersections. The Specific Plan Area and Community Park are located south of the intersection of Latrobe Road and Investment Boulevard and corresponds to the Folsom SE, California U.S. Geological Survey (USGS) 7.5-minute series quadrangle. The project also includes the installation of a sewer force main within the alignment of Latrobe Road and offsite improvements at three intersections in El Dorado Hills. These intersections are located at El Dorado Hills Boulevard and Saratoga Way; Golden Foothill Parkway and Robert J. Mathews Parkway; and Latrobe Road and Royal Oaks Drive.

1.1.1 Directions to the Survey Area

Please contact Winn Communities for access to the study area, as access is controlled by locked gates. Directions to the study area from Sacramento:

- Take US-50 east from Sacramento;
- Take exit 30A for Latrobe Road;
- Continue on Latrobe Road south to Investment Boulevard;
- Continue west on Investment Boulevard to Robert J. Mathews Parkway;
- Continue south on Robert J Mathews Parkway to the study area.

CHAPTER 2
Existing Conditions

2.1 Aquatic Resources Delineation Survey Area

The study area is in western El Dorado County south of the community of El Dorado Hills. Regionally, the site is located in the low Sierra Nevada foothills, just west of the Sierra Nevada Range, within the northern Sierra Nevada Foothills District of the California Floristic Province (Baldwin et al., 2012). Regional natural vegetation communities in the vicinity of the study area include those that are prevalent to the Sierra Nevada foothills, such as annual grasslands, blue oak woodlands, chamise chaparral, and mixed oak/foothill pine woodlands. Topography throughout the study area drains generally from east to west and is characterized by rolling hills and slopes. The elevation within the study area ranges from approximately 476 feet in the west to 642 feet on an isolated hill in the south and 662 feet at the intersection of El Dorado Hills Boulevard and Saratoga Way in the north.

2.2 Vegetation Communities and Wildlife Habitats

Wildlife habitats are generally described in terms of vegetation types along with landform, disturbance regime, and other unique environmental characteristics. Vegetation communities are assemblages of plant species that occur together in the same area, are repeated across landscapes, and are defined by species composition and relative abundance. Wildlife habitats generally correspond to vegetation communities. The wildlife habitat types described in this document were classified using the California Department of Fish and Wildlife's (CDFW) *A Guide to Wildlife Habitats of California* (Mayer and Laudenslayer, 1988), a habitat classification scheme that was developed to support the CDFW's California Wildlife Habitat Relationship (CWHR) System. The CWHR System is a wildlife information system and predictive model for California's regularly-occurring wildlife species. The vegetation types described in this report were classified according to *A Manual of California Vegetation, 2nd Edition* (Sawyer et al., 2009). Plant nomenclature follows *The Jepson Manual: Vascular Plants of California (Second Edition)* (Baldwin et al., 2012) as revised by the Jepson eFlora (Jepson Flora Project, 2021). Common names of plant species are derived from the Jepson Manual or Calflora (2021). A list of plant species observed during the surveys and their wetland indicator status is provided in **Appendix A**.

2.2.1 Aquatic Habitat Types

Valley Foothill Riparian

The vegetation of riparian habitats is quite variable and often structurally diverse. Usually, riparian habitat occurs along streambanks and lakeshores as a narrow, often dense grove of broad-

leaved, winter deciduous trees with an overstory tree layer and an understory shrub layer. In the study area, characteristic species of riparian wetlands include Goodding's black willow (*Salix gooddingii*), Fremont cottonwood (*Populus fremontii* subsp. *fremontii*), and red willow (*Salix laevigata*) trees in the overstory. The understory consists of sandbar willow (*Salix exigua*) and Himalayan blackberry (*Rubus armeniacus*), and a variety of grasses and forbs, including miner's lettuce (*Claytonia perfoliata*) and rye grass (*Festuca perennis*).

Seasonal Wetlands

Seasonal Wetland/Seep/Wetland Swale/Riverine Seasonal Wetland

These habitat types are discussed collectively due to the similarities in their vegetation composition, substrate, and hydrologic conditions. These communities exhibit variable hydrologic conditions but annually pond surface water or maintain saturated soils at the ground surface for long enough each year to support facultative or obligate wetland plant species. These wetlands support ponded or saturated soil conditions during winter and spring and are typically dry through the summer and fall. Vegetation is characterized by both annual and perennial species including native and non-native grasses and forbs. Plant species found within these wetlands are adapted to withstand intermittent periods of inundation, and typically initiate growth as aquatic or semi-aquatic plants and transition to a dry-land environment as the wetlands dries. Upland grasses and forbs often establish after wetland species desiccate and features become dry. Within the study area, these wetlands occur in depressions, swales, drainages, seeps, or low areas within annual grassland habitat. These communities are dominated by Mediterranean barley (*Hordeum marinum* subsp. *gussoneanum*), rye grass, rabbitsfoot grass (*Polypogon monspeliensis*), curly dock (*Rumex crispus*), and common toad rush (*Juncus bufonius*).

Riverine seasonal wetlands have a similar hydroperiod to the wetland communities described above, exhibiting variable hydrologic conditions but annually pond surface water or maintain saturated soils at the ground surface for long enough each year to support facultative or obligate wetland plant species. Riverine seasonal wetlands are contained within natural or man-made drainage channels. In the study area, these wetlands support a variety of wetland plant species, ranging from facultative wetland species such as rye grass and Mediterranean barley, to obligate wetlands species such as broad-leaved cattail (*Typha latifolia*).

Vernal Pool

Vernal pools are seasonal wetlands that occur in grasslands. These wetlands are typically found in slight depressions that form over bedrock or hardpan soils that allow water to pool during winter and spring rains. Vernal pools typically have an impervious layer of silicate-based hardpan underlying them that prevents water from percolating into the soil. Vernal pools are considered unique habitat and often support species that are endemic to vernal pools or other shallow pools in that particular geographic region. Vernal pool communities have been greatly reduced due to conversion of grasslands to agriculture or urban development. In the study area, vernal pools are dominated by coyote-thistle (*Eryngium castrense*), common toad rush (*Juncus bufonius*), and popcornflower (*Plagiobothrys* sp.).

Riverine

Riverine habitats are distinguished by intermittent or continually running water, and occur in association with a variety of terrestrial habitats. Carson Creek, a perennial channel, is the dominant riverine habitat feature within the study area. This feature flows year-round under typical climatic conditions. All features in the study area eventually drain to Carson Creek. The remaining drainage features in the study area are intermittent or ephemeral in nature and do not support flowing water year-round. Drainage features in the project site consist of perennial, intermittent, and ephemeral channels as well as man-made ditches and culverts. A perennial channel is a stream, or stream portion, that flows continuously during the calendar year. An intermittent channel has flowing water during certain times of the year, when precipitation or groundwater provides water for stream flow. During dry periods, intermittent streams may not have flowing water. In the study area, intermittent channels generally flow throughout the winter season and into the late spring or early summer. An ephemeral channel has flowing water only during, and for a short duration after, precipitation events in a typical year. Ephemeral stream beds are located above the water table year-round. Groundwater is not a source of water for the stream. Runoff from rainfall is the primary source of water for stream flow. This habitat type also includes a man-made drainage ditch located in the northwestern corner of the main project site. This shallow, graded ditch drains the adjacent parking lots to the north. Culverted portions of natural stream channels are also included in this habitat type.

2.2.2 Upland Habitats

Annual Grassland

Annual grassland, the most abundant habitat type in the study area, is an annual herbaceous plant community characterized mostly by naturalized annual grasses. In the study area, annual grassland is dominated by naturalized herbaceous annual grasses and forbs, with smaller patches with relatively high proportions of native grasses and forbs. The most abundant species in this community include non-native grasses such as wild oats (*Avena barbata*, *A. fatua*, *A. sativa*), bromes (*Bromus diandrus*, *B. hordeaceus*), barleys (*Hordeum marinum* subsp. *gussoneanum*, *H. murinum*), and fescues (*Festuca myuros*, *F. perennis*); non-native weedy herbaceous species including yellow star-thistle (*Centaurea solstitialis*), tall sock-destroyer (*Torilis arvensis*), Italian thistle (*Carduus pycnocephalus* subsp. *pycnocephalus*), vetch (*Vicia villosa*, *V. sativa* subsp. *sativa*), California burclover (*Medicago polymorpha*), broad-leaf filaree (*Erodium botrys*), black mustard (*Brassica nigra*), and shortpod mustard (*Hirschfeldia incana*); and native herbaceous species such as narrow tarplant (*Holocarpha virgata* subsp. *virgata*), yarrow (*Achillea millefolium*), and spikeweed (*Centromadia fitchii*). The native perennial purple needle grass (*Stipa pulchra*) was observed in the study area but was not present in sufficient density to be considered a separate habitat.

Blue Oak Woodland

There is a small grove of blue oaks (*Quercus douglasii*) in the southeast corner of the site. Annual grassland is found in the understory of this grove and surrounds the grove on all sides. The grove is located on the top of a steep rise, approximately 100 feet above the rest of the site. The trees

were generally in fair to good condition and ranged in size from 18 to 24 inches in diameter at breast height (DBH).

Developed/Disturbed

Developed portions of the study area include paved roads, sidewalks, parking lots, buildings, and associated infrastructure. These areas are paved or otherwise developed and generally lack natural vegetation. Vegetation associated with developed areas consists of ornamental shrubs and trees. Disturbed areas include roadsides and other areas with continuous disturbance which limits the establishment of vegetation. Plant species adapted to frequent disturbance observed in the disturbed areas include: stinkwort (*Dittrichia graveolens*), Russian thistle (*Salsola tragus*), short-pod mustard (*Hirschfeldia incana*), and yellow star-thistle (*Centaurea solstitialis*). Plant cover is extremely sparse; few individuals are established within the disturbed area.

2.3 Soils

The United States Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) Web Soil Survey was consulted to determine the soil units occurring within the delineation study area. The *Custom Soil Resource Report for El Dorado Area* (NRCS, 2021; included as **Appendix B**) shows six soil units occurring within the study area (**Table 1**). Two of these six units contain components that are listed by the NRCS on the national hydric soils list for El Dorado County, California (NRCS, 2021). A brief description of each soil unit is provided below. Please see Appendix B for a soils map showing the soil units in the study area, as well as a source for the following descriptions.

- **Argonaut very rocky loam, 3 to 30 percent slopes**, may have hydric components in the mapping unit on fan remnants. This soil unit occurs on ridges with parent material comprised of residuum weathered from andesite and/or residuum weathered from metasedimentary rock. This is a well-drained soil with a low available water capacity of about 3.9 inches. This map unit is composed of 75 percent Argonaut and similar soils, 15 percent rock outcrops, and 10 percent minor components. Minor components include Auburn and unnamed soils. The unnamed inclusions are listed as hydric.
- **Auburn silt loam, 2 to 30 percent slopes**, is not listed as a hydric soil. This soil unit occurs on hills with parent material comprised of residuum weathered from basic igneous rock and/or basic residuum weathered from metamorphic rock. This is a well-drained soil with a very low available water capacity of about 2.3 inches. This map unit is composed of 85 percent Auburn and similar soils, and 15 percent minor components. Minor components include Perkins, Sobrante, and Argonaut soils.
- **Auburn very rocky silt loam, 2 to 30 percent slopes**, is not listed as a hydric soil. This soil unit occurs on hills with parent material comprised of residuum weathered from basic igneous rock and/or basic residuum weathered from metamorphic rock. This is a well-drained soil with a very low available water capacity of about 2.3 inches. This map unit is composed of 75 percent Auburn and similar soils, 15 percent rock outcrops, and 10 percent minor components. Minor components include Boomer, Sobrante, Argonaut, and Unnamed soils.
- **Perkins gravelly loam, moderately deep variant, 2 to 5 percent slopes**, is not listed as a hydric soil. This soil unit occurs on hillslopes with parent material comprised of consolidated gravelly alluvium derived from igneous, metamorphic, and sedimentary rock. This is a

moderately well-drained soil with a low available water capacity of about 4.3 inches. This map unit is composed of 85 percent Perkins variant and similar soils, and 15 percent minor components. Minor components include Argonaut, Auburn, and Whiterock soils.

- **Placer diggings** may have hydric components in channels. This soil unit occurs in channels with parent material comprised of alluvium derived from mixed sources. This map unit is composed of 90 percent Placer diggings and 10 percent minor components. Minor components consist of unnamed soils. The unnamed inclusions are listed as hydric.
- **Whiterock gravelly silt loam, 3 to 50 percent slopes**, is not listed as a hydric soil. This soil unit occurs on hillslopes with parent material comprised of residuum weathered from slate. This is a somewhat excessively-drained soil with a very low available water capacity of about 1.0 inches. This map unit is composed of 85 percent Whiterock and similar soils, and 15 percent minor components. Minor components include Argonaut, Auburn, and rock outcrop soils.

TABLE 1
STUDY AREA SOIL UNITS

Soil Map Unit Name	Hydric Status	Landforms
AmD: Argonaut very rocky loam, 3 to 30 percent slopes	Hydric*	Ridges
AwD: Auburn silt loam, 2 to 30 slopes	Non-hydric	Hills
AxD: Auburn very rocky silt loam, 2 to 30 percent slopes	Non-hydric	Hills
PgB: Perkins gravelly loam, moderately deep variant, 2 to 5 percent slopes	Non-hydric	Hillslopes
PrD: Placer diggings	Hydric*	Channels
WhE: Whiterock gravelly silt loam, 3 to 50 percent slopes	Non-hydric	Hillslopes

NOTE:
* Soil unit contains minor component(s) that is (are) hydric, but the major component of the soil unit is not hydric.

SOURCE: NRCS, 2021

2.4 Hydrology

The study area is located in the Lower Cosumnes watershed. The main project site generally drains from east to west though a series of intermittent and ephemeral channels. These channels merge into a single channel just west of the study area boundary, which then flows to Carson Creek approximately 3,000 feet west of the study area. Latrobe Road and the three offsite improvement locations all drain to roadside swales or stormwater collection systems and eventually to Carson Creek. Carson Creek flows southwest to Deer Creek, which eventually joins the Cosumnes River. The Cosumnes River empties into the Mokelumne River in the Sacramento-San Joaquin Delta. The Mokelumne River is considered a traditional navigable water of the United States (TNW) from its mouth to Frandy Gage (3.5 miles upstream from New Hope Road) (**Figure 4**).

2.5 Climate

The overall Northern California climate is Mediterranean in nature, which is characterized by warm, dry summers and cool, wet winters, with the bulk of precipitation occurring as rain in the winter months. The climate in the El Dorado Hills area is temperate with mean annual precipitation of 25.80 inches and mean annual temperatures ranging from a high of 74 to a low of 50 degrees Fahrenheit (Western Regional Climate Center, 2021). The field investigation for this aquatic resources delineation was conducted on August 20, 2019 and January 13, 2021. According to the National Oceanic and Atmospheric Administration (NOAA), no rain had fallen in the study area in the seven days prior to any of the survey dates (NOAA, 2021). **Table 2** summarizes monthly total precipitation at the Folsom 1.2 SSE, CA weather station for recent years. The annual precipitation total through May 2020 for the region was below average according to the mean precipitation totals for the years 2015-2020. The USACE Antecedent Precipitation Tool (APT) was run for January 13, 2021, the day most of the datapoints were taken (**Appendix C**). According to the APT, the study area had drier than normal conditions during the 2020–2021 wet season. The Drought Index (PDSI) for the study area was categorized as "severe drought".

CHAPTER 3
Regulatory Framework

3.1 Waters of the U.S.

3.1.1 Clean Water Act

The CWA establishes the basic structure for regulating discharges of pollutants into waters of the United States and regulating quality standards for surface waters. The basis of the CWA was enacted in 1948 and was called the Federal Water Pollution Control Act, but the Act was significantly reorganized and expanded in 1972. "Clean Water Act" became the Act's common name with amendments in 1972.

Section 404 of the CWA establishes a program to regulate the discharge of dredged or fill material into waters of the United States, including wetlands. Activities in waters of the United States regulated under this program include fill for development, water resources projects (such as dams and levees), infrastructure development (such as highways and airports) and mining projects. Section 404 requires a permit before dredged or fill material maybe discharged into waters of the United States, unless the activity is exempt from Section 404 regulations (e.g., certain farming and forestry activities).

Wetlands are defined by USACE as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas." (33 CFR §328.3[c][1]; 40 CFR §120.2[c][1]). Indicators of three wetland parameters (i.e., hydric soils, hydrophytic vegetation, and wetlands hydrology), as determined by site investigation, must be present for a site to be classified as a wetland by USACE (Environmental Laboratory 1987).

Section 401 of the CWA gives the state authority to grant, deny, or waive certification of proposed federally licensed or permitted activities resulting in discharge to waters of the U.S. The state Water Resources Control Board (State Water Board) directly regulates multi-regional projects and supports the Section 401 certification and wetlands program statewide. The Regional Water Quality Control Board (RWQCB) regulates activities pursuant to Section 401(a)(1) of the federal CWA, which specifies that certification from the State is required for any applicant requesting a federal license or permit to conduct any activity including but not limited to the construction or operation of facilities that may result in any discharge into navigable waters. The certification shall originate from the State or appropriate interstate water pollution control agency in/where the discharge originates or will originate. Any such discharge will comply with the applicable provisions of Sections 301, 302, 303, 306, and 307 of the CWA.

3.1.2 Waters of the U.S.

Since its inception, the definition of the Waters of the U.S. has been a litigious issue. Most recently, the Supreme Court, ruling in *Sackett v. Environmental Protection Agency*, sharply limited the scope of the federal Clean Water Act's protection for the nation's waters. As a result of this decision, on August 29, 2023, the U.S. Environmental Protection Agency (EPA) and the USACE issued a final rule that amends the "Revised Definition of 'Waters of the United States'" to conform key aspects of the regulatory text to the U.S Supreme Court's decision.

Under the amended Revised Definition of "Waters of the United States," the term "waters of the United States" was defined as follows (33 CFR 328.3(a)):

(1) Waters which are:

(i) Currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;

(ii) The territorial seas; or

(iii) Interstate waters;

(2) Impoundments of waters otherwise defined as waters of the United States under this definition, other than impoundments of waters identified under paragraph (a)(5) of this section; To meet this category, you must be able to demonstrate that the current impoundment would have met the criteria of a water of the U.S. at the time of impoundment. Meaning that prior to the impoundment the feature would have met a(1), a(3), a(4) or a(5). This usually requires using historic aerial photos/maps or historic topo maps.

(3) Tributaries of waters identified in paragraph (a)(1) or (2) of this section that are relatively permanent, standing or continuously flowing bodies of water;

(4) Wetlands adjacent to the following waters:

(i) Waters identified in paragraph (a)(1) of this section; or

(ii) Relatively permanent, standing or continuously flowing bodies of water identified in paragraph (a)(2) or (a)(3) of this section and with a continuous surface connection to those waters;

(5) Intrastate lakes and ponds not identified in paragraphs (a)(1) through (4) of this section that are relatively permanent, standing or continuously flowing bodies of water with a continuous surface connection to the waters identified in paragraph (a)(1) or (a)(3) of this section.

In addition, the amended regulations include eight types of excluded waters (33 CFR 328.3(b)) which are not ''waters of the United States'' even where they otherwise meet the terms of paragraphs (a)(2) through (5) of this section:

(1) Waste treatment systems, including treatment ponds or lagoons, designed to meet the requirements of the Clean Water Act;

(2) Prior converted cropland designated by the Secretary of Agriculture. The exclusion would cease upon a change of use, which means that the area is no longer available for the production of agricultural commodities. Notwithstanding the determination of an area's status as prior converted cropland by any other Federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with EPA;

(3) Ditches (including roadside ditches) excavated wholly in and draining only dry land and that do not carry a relatively permanent flow of water;

(4) Artificially irrigated areas that would revert to dry land if the irrigation ceased;

(5) Artificial lakes or ponds created by excavating or diking dry land to collect and retain water and which are used exclusively for such purposes as stock watering, irrigation, settling basins, or rice growing;

(6) Artificial reflecting or swimming pools or other small ornamental bodies of water created by excavating or diking dry land to retain water for primarily aesthetic reasons;

(7) Waterfilled depressions created in dry land incidental to construction activity and pits excavated in dry land for the purpose of obtaining fill, sand, or gravel unless and until the construction or excavation operation is abandoned and the resulting body of water meets the definition of waters of the United States; and

(8) Swales and erosional features (e.g., gullies, small washes) characterized by low volume, infrequent, or short duration flow.

3.2 Waters of the State

3.2.1 Porter-Cologne Water Quality Control Act of 1969

Most projects involving water bodies or drainages are regulated by the RWQCB, the principal State agency overseeing water quality of the State at the local/regional level. The survey area is located within the region of the Central Valley RWQCB. RWQCBs are responsible for implementing Section 401 of the CWA as described above under the Clean Water Act.

In the absence of waters of the U.S., waters may be regulated under the Porter-Cologne Water Quality Control Act if project activities, discharges, or proposed activities or discharges could affect California's surface, coastal, or ground waters. The permit submitted by the applicant and issued by RWQCB is either a Water Quality Certification in the presence of waters of the U.S. or a Waste Discharge Requirement (WDR) in the absence of waters of the U.S.

The State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (State Wetland Definition and Procedures), as prepared by the State Water Resources Control Board, was adopted April 2, 2019, and revised April 6, 2021. The State Wetland Definition and Procedures include a definition for wetland waters of the state as well as exclusions for certain artificial wetlands, as listed below.

The Water Code defines "waters of the state" broadly to include "any surface water or groundwater, including saline waters, within the boundaries of the state." "Waters of the state" includes all "waters of the U.S." The following wetlands are waters of the state:

1. Natural wetlands,
2. Wetlands created by modification of a surface water of the state, and
3. Artificial wetlands that meet any of the following criteria:
    a. Approved by an agency as compensatory mitigation for impacts to other waters of the state, except where the approving agency explicitly identifies the mitigation as being of limited duration;
    b. Specifically identified in a water quality control plan as a wetland or other water of the state;
    c. Resulted from historic human activity, is not subject to ongoing operation and maintenance, and has become a relatively permanent part of the natural landscape; or
    d. Greater than or equal to one acre in size, unless the artificial wetland was constructed, and is currently used and maintained, primarily for one or more of the following purposes (i.e., the following artificial wetlands are not waters of the state unless they also satisfy the criteria set forth in 2, 3a, or 3b):
        i. Industrial or municipal wastewater treatment or disposal,
        ii. Settling of sediment,
        iii. Detention, retention, infiltration, or treatment of stormwater runoff and other pollutants or runoff subject to regulation under a municipal, construction, or industrial stormwater permitting program,
        iv. Treatment of surface waters,
        v. Agricultural crop irrigation or stock watering
        vi. Fire suppression,
        vii. Industrial processing or cooling,
        viii. Active surface mining – even if the site is managed for interim wetlands functions and values,
        ix. Log storage,
        x. Treatment, storage, or distribution of recycled water, or
        xi. Maximizing groundwater recharge (this does not include wetlands that have incidental groundwater recharge benefits); or
        xii. Fields flooded for rice growing.

3.3 Rivers, Streams, and Lakes

Pursuant to Division 2, Chapter 6, Section 1600 et seq. of the FGC, California Department of Fish and Wildlife (CDFW) regulates all diversions, obstructions, or changes to the natural flow or bed, channel or bank of any river, stream, or lake which supports fish or wildlife. A notification of a Lake or Streambed Alteration must be submitted to CDFW for "any activity that may

substantially change the bed, channel, or bank of any river, stream, or lake." In addition, CDFW has authority under FGC over wetland and riparian habitats associated with lakes and streams. The CDFW reviews proposed actions, and if necessary, submits to the applicant a proposal that includes measures to protect affected fish and wildlife resources. The final proposal that is mutually agreed upon by CDFW and the applicant is the Lake or Streambed Alteration Agreement (LSAA).

Fish and Game Code Section 2785 defines riparian habitat as "lands which contain habitat which grows close to and depends upon soil moisture from a nearby freshwater source." Additionally, the CDFW Notification Instructions and Process guide characterizes the riparian zone as "the area that surrounds a channel or lake and supports (or can support) vegetation that is dependent on surface or subsurface flow." Furthermore, this CDFW guide calls for the analysis of impacts to the riparian zone up to the outer landward edge of the drip line of riparian vegetation.

CHAPTER 4
Methodology

4.1 Pre-Field Review

Prior to conducting the field investigation, ESA biologists performed the following pre-field investigations:

- Review of the Folsom SE, CA U.S. Geological Survey (USGS) 7.5-minute topographic quadrangle map;
- Review of Google Earth aerial photographs of the study area for vegetative, topographic, and hydrographic signatures (Google Earth, 2021) (historic aerial photographs from 1993 – 2019 were reviewed as well as 2020 aerial photographs);
- Review of the *Custom Soil Resource Report for El Dorado Area, California*, for information about soils and geomorphology (NRCS, 2021);
- Review of the National Wetlands Inventory (U.S. Department of the Interior, 2021); and
- Review of the Arid West Regional Wetland Plant List (USACE, 2018).

4.2 Field Survey Methods

A delineation of aquatic resources within the survey area was conducted on August 20, 2019, and January 13, 2021, by ESA Biologists ESA biologists Joshua Boldt and Erich Fischer. The delineation was conducted by walking throughout the survey area to selected areas where potential jurisdictional features were identified during the literature review. Features that were identified as potentially jurisdictional included, but were not limited to, drainages that had an OHWM and defined channels with bed and bank, as well as potential wetlands evidenced by visible hydrologic indicators and/or hydrophytic vegetation. Additional data, such as landforms, vegetation, hydrology, and soils, were noted where these characteristics were pertinent to identification of features.

Potential jurisdictional features were identified and delineated following current federal and state methodology and guidelines, including waters of the U.S., waters of the State and FGC Section 1600 resources. Survey data forms are included in **Appendix D**.

4.2.1 Waters of the U.S.

Wetlands

The delineation used the "Routine Determination Method" as described in the *1987 Corps of Engineers Wetland Delineation Manual* (Environmental Laboratory 1987), hereafter called the "1987 Manual." The 1987 Manual was used in conjunction with the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (USACE 2008), hereafter called the "Arid West Supplement." For areas where the 1987 Manual and the Arid West Supplement differ, the Arid West Supplement was followed. Wetlands and waters were classified using commonly accepted habitat types; however, the Cowardin classification (Cowardin et al. 1979) of each feature type is noted in the discussion in Chapter 5.

To determine the extent of potential jurisdictional wetlands on a project site, the 1987 Manual and Arid West Supplement were used as a guide for identifying wetland characteristics. Three positive wetland parameters must normally be present for an area to be considered a wetland: 1) a dominance of wetland vegetation, 2) presence of hydric soils, and 3) presence of wetland hydrology. Presence or absence of positive indicators for wetland vegetation, soils and hydrology was assessed per the 1987 Manual and Arid West Supplement guidelines. Data points were taken within suspected wetlands and a paired point was taken (where applicable) in nearby upland areas. Data points were recorded on Arid West Region wetland determination data forms, which are provided in Appendix D.

At each data point, a visual assessment of the dominant plant species within the vegetation community was made. Dominant species were assessed using the recommended "50/20" rule per the Arid West Supplement. Plants were identified to species using the *The Jepson Manual: Vascular Plants of California, Second Edition* (Baldwin et al. 2012) .The *Arid West 2020 Regional Wetland Plant List* (USACE, 2020) was used to determine the wetland indicator status of all plants.

Hydric soils were identified using soil indicators presented in the *Regional Supplement to the* Arid West Supplement and the *Field Indicators of Hydric Soils in the United States*, Version 7.0, 2010 (NRCS 2010). Soils at each data point were characterized by color, texture, organic matter accumulation, and the presence or absence of hydric soil indicators. The coloration of the soil samples, matrix, and mottles is assessed using the *Munsell Soil Color Charts* (Munsell, 2000).

Presence of wetland hydrology was determined at each data point by presence of one or more of the primary and/or secondary indicators, per guidance of the Arid West Supplement.

Non-Wetland (Other) Waters of the U.S.

Non-wetland waters of the U.S. extend to the OHWM, defined in 33 CFR 328.3 as the line on the shore established by fluctuations of water and indicated by physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of the soil, destruction of terrestrial vegetation, or the presence of litter and debris. In the Arid West region of the United States, waters are variable and include ephemeral, intermittent and perennial channel forms. The most problematic ordinary high-water delineations are associated with the commonly occurring ephemeral and intermittent channel forms that dominate the Arid West landscape.

Delineation methods were completed in accordance with *A Field Guide to the Identification of the Ordinary High Water Mark in the Arid West Region of the Western United States* (USACE, 2008b) and *Updated Datasheet for the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (Curtis and Lichvar, 2010). OHWM data sheets are provided in Appendix D.

4.2.2 Waters of the State

Waters of the State outside of CWA Section 401 jurisdiction and subject to Porter-Cologne Water Quality Cologne Act and State Wetland Definition and Procedures were delineated to also include aquatic features up to the [ordinary high water mark OR top of bank OR the outer edge of riparian areas] per the delineation guidance provided by the Central Valley RWQCB.

4.2.3 Rivers, Streams, and Lakes

FGC Section 1600 resources were delineated to include bed, bank, and channel up to the top of bank, and/or associated wetlands and riparian vegetation to the outer drip line, whichever is wider.

4.2.4 Mapping and Acreage Calculations

All features, including wetland sample points, wetland boundaries, OHWM intervals, and stream channel courses were recorded using a global positioning system (GPS) with sub-meter accuracy or hand-recorded on aerial images of the study area. All sample points were also recorded using a Trimble GeoExplorer GPS. In the office, GPS data were downloaded and aquatic features mapped using Geographic Information System (GIS) software (ArcGIS 10.6.1) on an overlay of both topography and geo-referenced aerial photography. GPS-determined wetland boundaries and data points were visually confirmed. Acreages of wetland and waters of the U.S. polygons and the length of linear features were determined using ArcGIS.

CHAPTER 5
Results

5.1 Aquatic Resources

The aquatic resources delineation identified approximately 7.585 acres of aquatic resources in the study area. Aquatic habitats in the study area were classified using the *Classification of Wetlands and Deepwater Habitats of the United States* (FGDC, 2013) ("Cowardin Classification"). In the following aquatic resource descriptions, the Cowardin habitat type will follow the general habitat type in each habitat type header. A summary of the aquatic resources within the study area is presented in **Table 3** and described below (see **Table 4** in Section 5.2 for further details of on the individual aquatic features). **Figures 5-1** through **5-8** show the location and extent of the aquatic resources within the study area. The Aquatic Resources Spreadsheet is provided in **Appendix E**. Study area photographs are provided in **Appendix F**.

5.1.1 Wetlands

Seasonal Wetlands/Palustrine Emergent Wetland (Seasonally Flooded)

Seasonal Wetland/Seep/Wetland Swale/Riverine Seasonal Wetland

The seasonal wetlands within the study area are classified as Palustrine Emergent Wetland (Seasonally Flooded) using the *Classification of Wetlands and Deepwater Habitats of the United States* (FGDC, 2013). Seasonal wetland habitats in the study area include seasonal wetland (five features totaling 0.271 acre), seep (15 features totaling 1.119 acres), wetland swale (10 features totaling 1.116 acres), and riverine seasonal wetland (10 features totaling 0.620 acre). Seasonal wetlands are ephemeral wetlands that pond water or remain saturated for extended periods during a portion of the year, often throughout the wet season, then dry up in spring or early summer. Dominant plant species include rye grass (FAC[1]), Mediterranean barley (FAC), rabbitsfoot grass (FACW), curly dock (FAC), lesser hawkbit (FACU), toad rush (FACW), broad-leaved cattail (OBL), and hyssop loosestrife (OBL). Surface water was present in some of the seasonal wetlands in the study area at the time of the survey (December 2020) (Indicator A1 from the Arid West Supplement[2]), with saturation (Indicator A3) and high water table (Indicator A2) also noted. In addition, inundation visible in aerial imagery (Indicator B7), oxidized rhizospheres (Indicator C3, and saturation visible on aerial imagery (Indicator C9) were indicators of wetland hydrology observed in these wetlands. These features exhibited hydric soil indicators including soils with a depleted matrix (Indicator F3 from the Arid West Supplement[3]) and redox depressions (Indicator F8). Sample points 1, 4, 5, 6, 7, 8, 9, and 10 reflect the conditions observed in the seasonal wetlands during the field investigation and the surrounding upland areas are represented by sample points 12 and 14.

Vernal Pool/Palustrine Emergent Wetland (Seasonally Flooded)

Five vernal pools, totaling approximately 0.071 acre, were identified in the study area. This wetland type is characterized by shallow depressions that pond water throughout the winter and spring due to a restrictive soil layer that acts as a barrier preventing water percolation to deeper soil layers. Vernal pools are found within a larger grassland vegetation community and typically collect rainwater runoff from the adjacent upland areas. The pools are very different from the nearby upland grasslands both in their topography and soil characteristics as well as species composition. The annual cycle of inundation and drying of vernal pools has facilitated the evolution of plant species uniquely adapted to these conditions. In the study area, vernal pools are dominated by coyote-thistle (FACW), toad rush (FACW), and popcornflower (FACW). Wetland hydrology indicators observed in these features include inundation (Indicator A1), a high water table (10 inches below the surface) (Indicator A2), saturation (6 inches below the surface) (Indicator A3), and sediment deposits (Indicator B2). Hydric soils were indicated in this feature by the presence of a redox dark surface (Indicator F6) and redox depressions (Indicator F8).

1 FAC = facultative (occurs in wetlands and non-wetlands); FACW = facultative wetland (usually occurs in wetlands, but may occur in non-wetlands); OBL = obligate wetland (almost always occurs in wetlands under natural conditions); NL = not listed.

2 Wetland hydrology indicators are presented in four groups in the Arid West Supplement. Group A: Observation of Surface Water or Saturated Soils. Group B: Evidence of Recent Inundation. Group C: Evidence of Current or Recent Soil Saturation. Group D: Evidence from Other Site Conditions or Data.

3 Hydric soil indicators are presented in three groups in the Arid West Supplement. Group A: Indicators for All Soils. Group F: Indicators for Loamy and Clayey Soils. Group S: Indicators for Sandy Soils.

Sample points DP 2, 13, 18, and 20 reflect the conditions observed in the freshwater seasonal wetlands during the field investigation and the surrounding upland areas are represented by sample points DP-3, 14, 19, and 21 (Appendix D).

Riparian Wetland/Palustrine Forested Wetland (Seasonally Flooded)

Thirteen riparian wetlands, totaling approximately 1.251 acres, were identified in the study area. Riparian wetlands in the study area are classified as Palustrine Forested Wetlands (Seasonally Flooded) using the *Classification of Wetlands and Deepwater Habitats of the United States* (FGDC, 2013). Palustrine forested wetlands in the study area are dominated by woody vegetation, mainly willows and cottonwood trees. Three riparian wetlands occur along Carson Creek, a perennial channel, and the other riparian wetlands occur in a depression on the northwestern border of the main project site. The overstory of these wetlands include Goodding's black willow (FACW), Fremont cottonwood (NL), and red willow (FACW) trees in the overstory. The understory consists of sandbar willow (FACW) and Himalayan blackberry (FAC), and a variety of grasses and forbs, including miner's lettuce (FAC) and rye grass (FAC). Wetland hydrology indicators observed in these features include inundation (Indicator A1), a high water table (10 inches below the surface) (Indicator A2), saturation (6 inches below the surface) (Indicator A3), and sediment deposits (Indicator B2). Hydric soils were indicated in these features by the presence of a redox dark surface (Indicator F6) and redox depressions (Indicator F8). Sample points DP 2, 13, 18, and 20 reflect the conditions observed in the freshwater seasonal wetlands during the field investigation and the surrounding upland areas are represented by sample points DP 3, 14, 19, and 21 (Appendix D).

5.1.2 Other Waters

Perennial Channel/Riverine Perennial

Perennial channels are classified as "riverine perennial" using the *Classification of Wetlands and Deepwater Habitats of the United States* (FGDC, 2013). A perennial channel is a stream, or stream portion, that flows continuously during the calendar year. One perennial channel segment (P-1, Carson Creek), totaling approximately 0.297 acre, was identified in the study area. Bed material consists of cobbles, mud, and sand. Carson Creek supports sporadic patches of freshwater emergent wetland species within the channel and riparian species along its lower and upper banks.

Intermittent Channel/Riverine Intermittent

Intermittent channels are classified as Riverine Intermittent using the *Classification of Wetlands and Deepwater Habitats of the United States* (FGDC, 2013). An intermittent channel has flowing water during certain times of the year, when precipitation or groundwater provides water for stream flow. During dry periods, intermittent streams may not have flowing water. In the study area, intermittent channels generally flow throughout the winter season and into the late spring or early summer. Two intermittent channel segments (I-1 and I-2), totaling approximately 1.201 acres, were identified in the study area. In general, these channels are medium to low gradient and are bordered by annual grasslands. Bed material consists of sand, fine and medium gravel, and cobbles, but the beds are typically not vegetated.

Ephemeral Channel/Riverine Ephemeral

Ephemeral channels are classified as Riverine Ephemeral using the *Classification of Wetlands and Deepwater Habitats of the United States* (FGDC, 2013). An ephemeral channel has flowing water only during, and for a short duration after, precipitation events in a typical year. Ephemeral stream beds are located above the water table year-round. Groundwater is not a source of water for the stream. Runoff from rainfall is the primary source of water for stream flow. The study area contains nine ephemeral channel segments (E-1a, E-1b, E-2, E-3, E-4a, E-4b, and E-5 through E-7), totaling approximately 1.579 acres. Ephemeral channels in the study area are typically medium to high-gradient and flow through annual grassland. Bed material consists of soil, sand, and gravel, and the beds are typically not vegetated.

Culverted Streams

Because a portion of the study area consists of the right-of-way of Latrobe Road, many of the stream segments delineated are partially or completely culverted within the study area. Culverted streams do not have a classification under the *Classification of Wetlands and Deepwater Habitats of the United States* (FGDC, 2013). Twelve culverted stream segments (CUL-1 through CUL-12), totaling approximately 0.044 acre, were identified in the study area.

Ditches

Ditches do not have a classification under the *Classification of Wetlands and Deepwater Habitats of the United States* (FGDC, 2013). One ditch segment (D-2), totaling approximately 0.014 acre, was identified in the study area. This ditch is a constructed feature built for the purpose of draining the adjacent parking lots to the north. This feature was excavated in uplands and is not a traditional navigable water, not a relocated tributary, and is not constructed in adjacent wetlands.

5.2 Analysis of Waters of the United States

As defined under Section 3.1, under the Revised Definition of Waters of the U.S, there are five categories that are considered jurisdictional waters of the U.S. These categories include (a)(1) territorial seas and waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including waters which are subject to the ebb and flow of the tide, and interstate waters, including interstate wetlands; (a)(2) impoundments of waters of the U.S; (a)(3) tributaries of waters of the U.S that are RPWs; (a)(4) wetlands adjacent to RPWs or maintain a continuous surface connection to RPWs; and (a)(5) intrastate lakes and ponds that are RPWs or maintain a continuous surface connection to RPWs. See Table 4, below, for an evaluation of the aquatic resources in the survey area that meet the Revised Definition of Waters of the U.S.

The mapped 2.824 acres of wetlands and other waters are expected to be waters of the United States pursuant to 33 CFR 328.3(a)(3) and (a)(4). Thus, these features are expected to be subject to USACE and Central Valley Regional Water Quality Control Board jurisdiction under CWA Sections 404 and 401, and/or the Porter-Cologne Water Quality Control Act.

NOTE: Differences between values and totals are due to minor rounding differences.

5.2.1 Potentially Jurisdictional Wetlands

There are 1.314 acres of wetlands (riparian wetlands RW-3 through RW-10, RW-12, and RW-13, riverine seasonal wetlands RSW-5 through RSW-8, wetland swale SW-6, and WS-10) are adjacent to other jurisdictional waters and have direct hydrologic surface connections to another jurisdictional non-wetland relatively permanent water (RPW). Therefore, these wetlands are expected to be subject to Corps' jurisdiction.

5.2.2 Potentially Jurisdictional Other Waters

There are 1.514 acres of other waters (perennial drainage P-1, intermittent channels I-1 and I-2, and culvert features (CUL-9, CUL-10, CUL-11) are RPWs that flow directly or indirectly into a TNW, and are therefore waters of the United States. Carson Creek (P-1) is a perennial tributary (during a typical year this feature flows year-round) that contributes surface water flow in a typical year to a downstream jurisdictional water (Mokelumne River – TNW). Intermittent channels I-1 and I-2 are intermittent tributaries (during a typical year these features flow continuously during certain times of the year and more than in direct response to precipitation) that contribute surface water flow to a downstream jurisdictional water (Mokelumne River – TNW). Portions of I-1 are culverted (CUL-9, CUL-10, CUL-11) under Latrobe Road and convey the perennial or intermittent features described above. Therefore, these other waters features are expected to be subject to Corps' jurisdiction.

5.2.3 Non-Jurisdictional Wetlands

Wetland features including riparian wetlands RW-1, RW-2 and RW 11; riverine seasonal wetland RSW-1 through RSW-4, RSW9 and RSW-10; seasonal wetland SW-1 through SW-5 and SW-7; all seep features S-1through S-17; all vernal pools VP 1 through VP-5; wetland swales WS-1 through WS-9 are not expected to be waters of the U.S. These features are wetlands that are not RPWs, and they do not have a continuous hydrologic surface connection to RPWs. Therefore, these wetlands totaling 3.133 acres are not considered waters of the U.S. under the 2023 NWPR (33 CFR Section 328.3(a)(4) waters).

5.2.4 Non-Jurisdictional Non-Wetland Features

Non-RPWs that lack a continuous surface connection to a water of the U.S. do not qualify as waters of the United States. A total of 1.623 acres of non-wetland features identified within the study area are not expected to be subject to Corps' jurisdiction under the 2023 NWPR and supporting rationale is provided below.

All ephemeral channels (E-1 through E-7) flow only in direct response to precipitation and are not RPWs. These features lack a continuous surface connection to RPWs and are not considered waters of the U.S. under the 2023 Navigable Waters Protection Rule (NWPR) (33 CFR Section 328.3(a)(3) waters).

The ditch (D-2) feature is a constructed drainage ditch that is not a traditional navigable water, not an RPW, does not have a continuous surface connection to an RPW, not a relocated tributary,

and was not constructed in adjacent wetlands. This feature is not considered waters of the U.S. under the 2023 NWPR (33 CFR Section 328.3(b)(3) waters).

Culverts (CUL-1 through CUL-8, and CUL-12) are considered non-jurisdictional features under the 2023 NWPR (33 CFR Section 328.3(a)(3) waters) since they connect ephemeral channels that are not RPWs and lack a continuous connection to downstream RPWs.

5.3 Analysis of Waters of the State

The State Wetland Definition and Procedures defines "water of the state" broadly to include "any surface water or groundwater, including saline waters, within the boundaries of the state." All features that are waters of the U.S. are also waters of the state. The State Water Board has not adopted a definition for non-wetland waters of the state, however the Porter-Cologne Water Quality Control Act regulates project activities, discharges, or proposed activities or discharges that could affect California's surface, coastal, or ground waters. Therefore, ephemeral channels that are not expected to qualify as waters of the U.S. are likely to qualify as waters of the state at the discretion of the RWQCB.

All non-wetland features identified, with the exception of ditch D-2, are expected to be considered waters of the state by the RWQCB. Ditch 2 may not qualify as a water of the state given its construction in uplands and degree of isolation. Although the Boards have not adopted a definition of non-wetland waters, the definition used for which wetlands qualify as waters of the state suggests that the RWQCB may not claim jurisdiction over small, artificial features that are subject to ongoing maintenance, such as Ditch 2 (0.014 acre).

All of the wetlands identified in the study area, with the exception of SW-7, are likely to meet the definition of wetlands defined as waters of the state (see Section 3.3.1), because they are either "natural wetlands", wetlands created by a modification of a surface water of the state, or they resulted from historic human activity and are not subject to ongoing operation and maintenance. SW-7 (0.004 acre) is in a constructed swale next to Latrobe Road, does not appear to be a realigned natural feature, and is likely subject to ongoing operation and maintenance by El Dorado County Department of Transportation for road drainage. Therefore, SW-7 (0.004 acre) may not qualify as a water of the state.

Based on the State Wetland Definition and Procedure and the Porter-Cologne Water Quality Control Act, a total of 7.567 acres of wetlands and non-wetland waters are expected to qualify as waters of the state. These features include all wetlands and non-wetlands identified except for ditch D-2 and seasonal wetland SW-7 based on the rationale described above.

5.4 Analysis of Section 1600 Regulated Areas

Pursuant to Division 2, Chapter 6, Section 1600 et seq. of the FGC, CDFW regulates diversions, obstructions, or changes to the natural flow or bed, channel or bank of any river, stream, or lake. Under FGC Section 1602 (Lake and Streambed Alteration Agreements), CDFW will generally include the "stream zone" up to the top of bank or outside extent of riparian vegetation, whichever is the greatest, although CDFW may at their discretion include any project activities

where material may pass into the stream. Features identified expected to be subject to CDFW regulation include riparian wetlands (RW-3 through RW-10, and RW-12 through RW-13), riverine seasonal wetlands (RSW-5 through RSW-8), seasonal wetland SW-6, wetland swale WS-10, perennial drainage P-1, intermittent drainages (I-1 and I-2), ephemeral drainages (E-1a, E-1b, E-2 through E-7), and culverts (CUL-1 through CUL-12), which collectively total 4.437 acres. CDFW is likely to require a 1600 notification of streambed alteration for all of the channels in the study area, regardless of hydrology, including any wetlands that may be connected to the channels during times of high water.

5.5 Conclusions

A total of 7.585 acres of aquatic resources occur within the 271.81-acre study area. This includes approximately 2.828 acres of aquatic resources that qualify as waters of the U.S. The other 4.756 acres of aquatic resources are not expected to qualify as waters of the U.S. due to these features not being RPWs and the lack of a continuous connection with RPWs that drain to the nearest downstream traditional navigable water, the lower Cosumnes River.

A total of 7.567 acres of aquatic resources are expected to qualify as waters of the state subject to regulation under Section 401 of the CWA and/or the Porter-Cologne Water Quality Control Act. Ditch 2 and SW-7 are not expected to qualify as waters of the state. All of the perennial, intermittent, and ephemeral channels and abutting wetlands and riparian features, which total 4.437 acres, are expected to be subject to regulation under Section 1600 of the FGC.

This report documents the boundary delineation for these aquatic features and best professional judgment of ESA investigators. All aquatic resources and extent of potentially jurisdictional boundaries identified in this report are considered preliminary pending verification from the appropriate regulatory agencies.

Scientific Name	Common Name	Wetland Indicator Status
Apiaceae		
Daucus carota	Wild carrot	UPL
Eryngium vaseyi	Coyote-thistle	FACW
Foeniculum vulgare	Fennel	NL
Torilis arvensis	Tall sock-destroyer	NL
Apocynaceae		
Asclepias fascicularis	Narrow leaf milkweed	FAC
Araceae		
Lemna minuta	Least duckweed	OBL
Asteraceae		
Achillea millefolium	Yarrow	FACU
Achyrachaena mollis	Blow-wives	FAC
Artemisia douglasiana	Douglas' milkwort	FAC
Baccharis pilularis	Coyote brush	NL
Baccharis salicifolia	Coyote brush	FAC
Carduus pycnocephalus subsp. *pycnocephalus*	Italian thistle	NL
Centaurea solstitialis	Yellow star-thisIte	NL
Centromadia fitchii	Spikeweed	FACU
Centromadia pungens subsp. *pungens*	Common spikeweed	FAC
Dittrichia graveolens	Stinkwort	NL
Erigeron canadensis	Canada horseweed	FACU
Helminthotheca echioides	Bristly ox-tongue	FAC
Holocarpha virgata subsp. *virgata*	Narrow tarplant	NL
Hypochaeris glabra	Smooth cat's-ear	NL
Hypochaeris radicata	Hairy cat's-ear	FACU
Lactuca serriola	Prickly lettuce	FACU
Leontodon saxatilis	Lesser hawkbit	FACU
Senecio vulgaris	Common groundsel	FACU
Silybum marianum	Milk thistle	NL
Sonchus oleraceus	Common sow thistle	UPL
Xanthium strumarium	Rough cocklebur	FAC
Boraginaceae		
Amsinckia menziesii	Menzies' fiddleneck	NL
Plagiobothrys stipitatus var. *micranthus*	Common vernal pool allocarya	FACW
Brassicaceae		
Brassica nigra	Black mustard	NL
Capsella bursa-pastoris	Shepherd's purse	NL
Hirschfeldia incana	Mustard	NL
Lepidium latifolium	Perennial pepperweed	FAC
Nasturtium officinale	Watercress	OBL
Raphanus sativus	Radish	NL
Convolvulaceae		
Convolvulus arvensis	Bindweed	NL

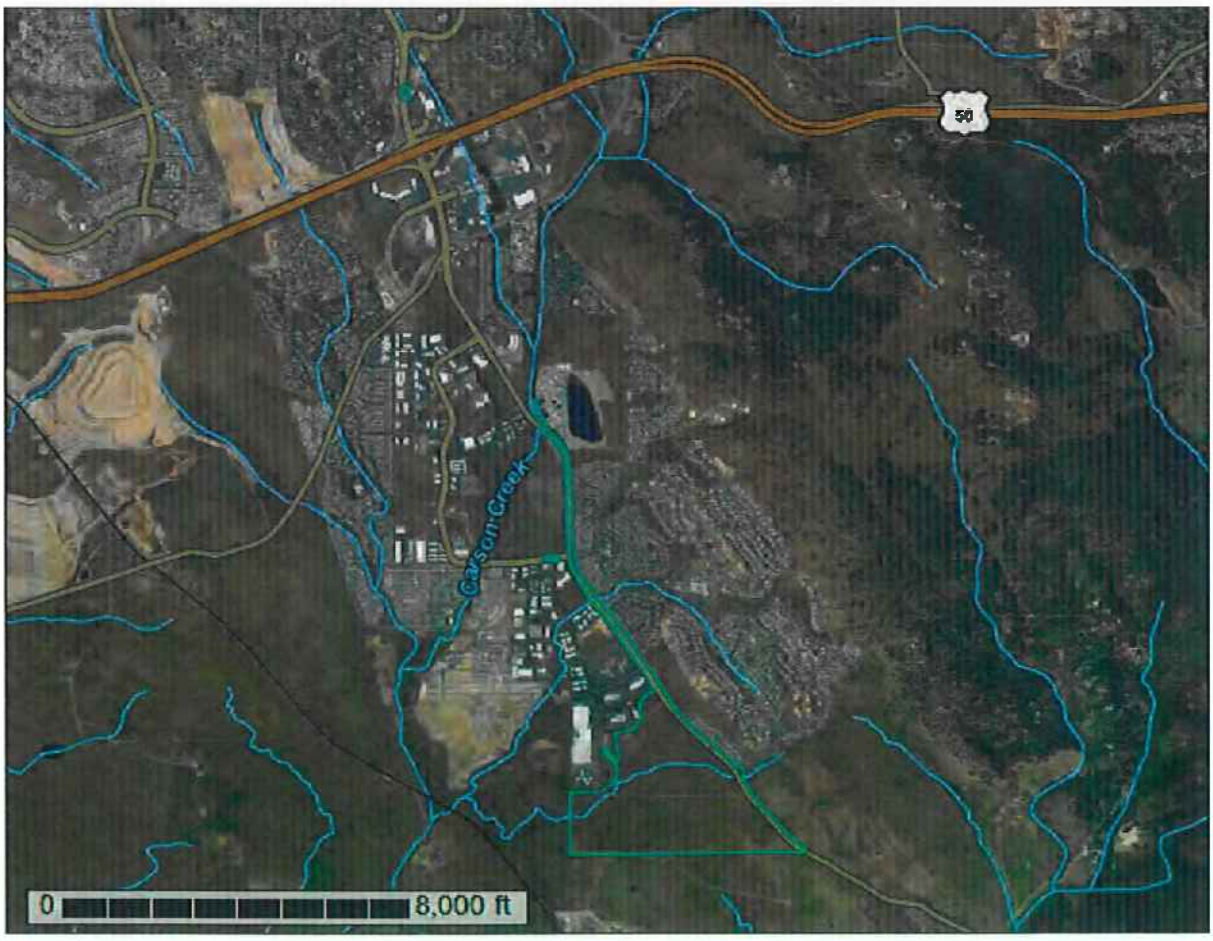
A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for El Dorado Area, California

Creekside Village



January 15, 2021

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/?cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: El Dorado Area, California
Survey Area Data: Version 12, May 29, 2020

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: May 8, 2019—May 12, 2019

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
AmD	Argonaut very rocky loam, 3 to 30 percent slopes	37.9	13.7%
AwD	Auburn silt loam, 2 to 30 percent slopes	7.4	2.7%
AxD	Auburn very rocky silt loam, 2 to 30 percent slopes	144.2	52.1%
PgB	Perkins gravelly loam, moderately deep variant, 2 to 5 percent slopes	69.0	24.9%
PrD	Placer diggings	1.5	0.5%
WhE	Whiterock gravelly silt loam, 3 to 50 percent slopes	16.9	6.1%
Totals for Area of Interest		**277.0**	**100.0%**

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it

was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

El Dorado Area, California

AmD—Argonaut very rocky loam, 3 to 30 percent slopes

Map Unit Setting

National map unit symbol: hhyd
Elevation: 120 to 2,500 feet
Mean annual precipitation: 20 to 50 inches
Mean annual air temperature: 55 to 63 degrees F
Frost-free period: 220 to 270 days
Farmland classification: Not prime farmland

Map Unit Composition

Argonaut and similar soils: 75 percent
Rock outcrop: 15 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Argonaut

Setting

Landform: Ridges
Landform position (two-dimensional): Shoulder
Landform position (three-dimensional): Interfluve
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Residuum weathered from andesite and/or residuum weathered from metasedimentary rock

Typical profile

H1 - 0 to 10 inches: gravelly loam
H2 - 10 to 30 inches: clay
H3 - 30 to 36 inches: weathered bedrock

Properties and qualities

Slope: 3 to 30 percent
Depth to restrictive feature: 30 to 36 inches to paralithic bedrock
Drainage class: Well drained
Runoff class: Medium
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Low (about 3.9 inches)

Interpretive groups

Land capability classification (irrigated): 6e
Land capability classification (nonirrigated): 6e
Hydrologic Soil Group: D
Ecological site: F018XI201CA - Moderately Deep Thermic Foothills 22-31 PZ
Hydric soil rating: No

Description of Rock Outcrop

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Hydric soil rating: No

Minor Components

Auburn

Percent of map unit: 9 percent
Landform: Hills
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Concave
Across-slope shape: Convex
Hydric soil rating: No

Unnamed

Percent of map unit: 1 percent
Landform: Fan remnants
Hydric soil rating: Yes

AwD—Auburn silt loam, 2 to 30 percent slopes

Map Unit Setting

National map unit symbol: hhyq
Elevation: 120 to 3,000 feet
Mean annual precipitation: 20 to 40 inches
Mean annual air temperature: 55 to 63 degrees F
Frost-free period: 175 to 275 days
Farmland classification: Not prime farmland

Map Unit Composition

Auburn and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Auburn

Setting

Landform: Hills
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Concave
Across-slope shape: Convex
Parent material: Residuum weathered from basic igneous rock and/or basic residuum weathered from metamorphic rock

Typical profile

H1 - 0 to 14 inches: silt loam
H2 - 14 to 18 inches: unweathered bedrock

Properties and qualities

Slope: 2 to 30 percent
Depth to restrictive feature: 14 to 18 inches to lithic bedrock
Drainage class: Well drained
Runoff class: Low
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Very low (about 2.3 inches)

Interpretive groups

Land capability classification (irrigated): 6e
Land capability classification (nonirrigated): 6e
Hydrologic Soil Group: D
Ecological site: F018XI200CA - Low Elevation Foothills 18-25 PZ
Hydric soil rating: No

Minor Components

Perkins

Percent of map unit: 4 percent
Hydric soil rating: No

Sobrante

Percent of map unit: 4 percent
Landform: Hillslopes
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Concave
Across-slope shape: Convex
Hydric soil rating: No

Argonaut

Percent of map unit: 4 percent
Landform: Ridges
Landform position (two-dimensional): Shoulder
Landform position (three-dimensional): Interfluve
Down-slope shape: Linear
Across-slope shape: Linear
Hydric soil rating: No

Rock outcrop

Percent of map unit: 3 percent
Hydric soil rating: No

AxD—Auburn very rocky silt loam, 2 to 30 percent slopes

Map Unit Setting

National map unit symbol: hhyr
Elevation: 120 to 3,000 feet
Mean annual precipitation: 20 to 40 inches
Mean annual air temperature: 55 to 63 degrees F
Frost-free period: 175 to 275 days
Farmland classification: Not prime farmland

Map Unit Composition

Auburn and similar soils: 75 percent
Rock outcrop: 15 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Auburn

Setting

Landform: Hills
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Concave
Across-slope shape: Convex
Parent material: Residuum weathered from basic igneous rock and/or basic residuum weathered from metamorphic rock

Typical profile

H1 - 0 to 14 inches: silt loam
H2 - 14 to 18 inches: unweathered bedrock

Properties and qualities

Slope: 2 to 30 percent
Depth to restrictive feature: 14 to 18 inches to lithic bedrock
Drainage class: Well drained
Runoff class: Medium
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Very low (about 2.3 inches)

Interpretive groups

Land capability classification (irrigated): 6e
Land capability classification (nonirrigated): 6e
Hydrologic Soil Group: D
Ecological site: R018XD076CA - SHALLOW LOAMY
Hydric soil rating: No

Description of Rock Outcrop

Setting

Parent material: Metamorphic rock

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Hydric soil rating: No

Minor Components

Boomer

Percent of map unit: 3 percent
Landform: Mountain slopes, hillslopes
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Mountainflank, side slope
Down-slope shape: Concave
Across-slope shape: Convex
Hydric soil rating: No

Argonaut

Percent of map unit: 3 percent
Landform: Ridges
Landform position (two-dimensional): Shoulder
Landform position (three-dimensional): Interfluve
Down-slope shape: Linear
Across-slope shape: Linear
Hydric soil rating: No

Sobrante

Percent of map unit: 2 percent
Landform: Hillslopes
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Concave
Across-slope shape: Convex
Hydric soil rating: No

Unnamed

Percent of map unit: 2 percent
Hydric soil rating: No

PgB—Perkins gravelly loam, moderately deep variant, 2 to 5 percent slopes

Map Unit Setting

National map unit symbol: hj0v
Elevation: 450 to 700 feet

Mean annual precipitation: 25 inches
Mean annual air temperature: 63 degrees F
Frost-free period: 170 to 270 days
Farmland classification: Farmland of statewide importance

Map Unit Composition

Perkins variant and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Perkins Variant

Setting

Landform: Hillslopes
Landform position (two-dimensional): Backslope, summit
Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Convex
Parent material: Consolidated gravelly alluvium derived from igneous, metamorphic and sedimentary rock

Typical profile

H1 - 0 to 12 inches: gravelly loam
H2 - 12 to 17 inches: clay loam
H3 - 17 to 30 inches: very gravelly sandy clay loam
H4 - 30 to 37 inches: sandy clay
H5 - 37 to 41 inches: unweathered bedrock

Properties and qualities

Slope: 2 to 5 percent
Depth to restrictive feature: 37 to 41 inches to lithic bedrock
Drainage class: Moderately well drained
Runoff class: Low
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Low (about 4.3 inches)

Interpretive groups

Land capability classification (irrigated): 3e
Land capability classification (nonirrigated): 3e
Hydrologic Soil Group: C
Ecological site: F018XI200CA - Low Elevation Foothills 18-25 PZ
Hydric soil rating: No

Minor Components

Argonaut

Percent of map unit: 5 percent
Landform: Ridges
Landform position (two-dimensional): Shoulder
Landform position (three-dimensional): Interfluve
Down-slope shape: Linear
Across-slope shape: Linear
Hydric soil rating: No

Auburn

Percent of map unit: 5 percent
Landform: Hills
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Concave
Across-slope shape: Convex
Hydric soil rating: No

Whiterock

Percent of map unit: 5 percent
Landform: Hillslopes
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Concave
Across-slope shape: Convex
Hydric soil rating: No

PrD—Placer diggings

Map Unit Composition

Placer diggings: 90 percent
Minor components: 10 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Placer Diggings

Setting

Parent material: Alluvium derived from mixed sources

Typical profile

H1 - 0 to 60 inches: fine sandy loam, cobbles

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 8
Ecological site: R018XD084CA - PLACER DIGGINGS
Hydric soil rating: No

Minor Components

Unnamed

Percent of map unit: 10 percent
Landform: Channels
Hydric soil rating: Yes

WhE—Whiterock gravelly silt loam, 3 to 50 percent slopes

Map Unit Setting

National map unit symbol: hj20
Elevation: 300 to 2,000 feet
Mean annual precipitation: 20 inches
Mean annual air temperature: 61 degrees F
Frost-free period: 250 days
Farmland classification: Not prime farmland

Map Unit Composition

Whiterock and similar soils: 85 percent
Minor components: 15 percent
Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Whiterock

Setting

Landform: Hillslopes
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Concave
Across-slope shape: Convex
Parent material: Residuum weathered from slate

Typical profile

H1 - 0 to 8 inches: gravelly silt loam
H2 - 8 to 12 inches: unweathered bedrock

Properties and qualities

Slope: 3 to 50 percent
Depth to restrictive feature: 8 to 12 inches to lithic bedrock
Drainage class: Somewhat excessively drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Low to high (0.01 to 1.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Very low (about 1.0 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 7e
Hydrologic Soil Group: D
Ecological site: R018XD085CA - VERY SHALLOW LOAMY
Hydric soil rating: No

Minor Components

Auburn

Percent of map unit: 7 percent

Landform: Hills
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Concave
Across-slope shape: Convex
Hydric soil rating: No

Argonaut

Percent of map unit: 6 percent
Landform: Ridges
Landform position (two-dimensional): Shoulder
Landform position (three-dimensional): Interfluve
Down-slope shape: Linear
Across-slope shape: Linear
Hydric soil rating: No

Rock outcrop

Percent of map unit: 2 percent
Hydric soil rating: No

Appendix D
Data Sheets

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Creekside Village City/County: El Dorado County Sampling Date: 1/13/21
Applicant/Owner: Winn Communities State: CA Sampling Point: DP-1
Investigator(s): Joshua Boldt Section, Township, Range: _____
Landform (hillslope, terrace, etc.): _____ Local relief (concave, convex, none): _____ Slope (%): _____
Subregion (LRR): C - Mediterranean California Lat: _____ Long: _____ Datum: _____
Soil Map Unit Name: _____ NWI classification: _____
Are climatic / hydrologic conditions on the site typical for this time of year? Yes _____ No ✓ (If no, explain in Remarks.)
Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____
Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ✓ No _____	**Is the Sampled Area within a Wetland?** Yes ✓ No _____
Hydric Soil Present?	Yes ✓ No _____	
Wetland Hydrology Present?	Yes ✓ No _____	

Remarks:
Climatic/hydrologic conditions were not typical as the 2020-2021 wet season was drier than normal. The PDSI for the study area was categorized as "severe drought". Feature is seasonal wetland associated with intermittent drainage/riverine wetland.

VEGETATION – Use scientific names of plants.

	Absolute % Cover	Dominant Species?	Indicator Status

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ Stratified Layers (A5) (**LRR C**)
- ___ 1 cm Muck (A9) (**LRR D**)
- ___ Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)
- ___ Sandy Mucky Mineral (S1)
- ___ Sandy Gleyed Matrix (S4)
- ___ Sandy Redox (S5)
- ___ Stripped Matrix (S6)
- ___ Loamy Mucky Mineral (F1)
- ___ Loamy Gleyed Matrix (F2)
- ___ Depleted Matrix (F3)
- ✓ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes ✓ No ___

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ✓ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ✓ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ✓ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ___ No ✓ Depth (inches): _____

Water Table Present? Yes ___ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes ___ No ✓ Depth (inches): _____

Wetland Hydrology Present? Yes ✓ No ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Surface Water Present? Yes ___ No ✓ Depth (inches): _____

Water Table Present? Yes ___ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes ___ No ✓ Depth (inches): _____

Wetland Hydrology Present? Yes ✓ No ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Creekside Village City/County: El Dorado County Sampling Date: 1/13/21

Applicant/Owner: Winn Communities State: CA Sampling Point: DP-3

Investigator(s): Joshua Boldt Section, Township, Range: _____

Landform (hillslope, terrace, etc.): _____ Local relief (concave, convex, none): _____ Slope (%): _____

Subregion (LRR): C - Mediterranean California Lat: _____ Long: _____ Datum: _____

Soil Map Unit Name: _____ NWI classification: _____

Are climatic / hydrologic conditions on the site typical for this time of year? Yes _____ No ✓ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes _____ No ✓	**Is the Sampled Area within a Wetland?** Yes _____ No ✓
Hydric Soil Present?	Yes ✓ No _____	
Wetland Hydrology Present?	Yes _____ No ✓	

Remarks:

Climatic/hydrologic conditions were not typical as the 2020-2021 wet season was drier than normal. The PDSI for the study area was categorized as "severe drought".

VEGETATION – Use scientific names of plants.

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes _____	No ✓	**Is the Sampled Area within a Wetland?** Yes _____ No ✓
Hydric Soil Present?	Yes _____	No ✓	
Wetland Hydrology Present?	Yes _____	No ✓	

Remarks:

Climatic/hydrologic conditions were not typical as the 2020-2021 wet season was drier than normal. The PDSI for the study area was categorized as "severe drought". Feature is minor swale but does not meet wetland parameters.

VEGETATION – Use scientific names of plants.

- ___ Depleted Matrix (F3)
- ___ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ✓ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: hardpan/cobbles

Depth (inches): 8

Hydric Soil Present? Yes ✓ No ___

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ✓ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ✓ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ✓ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ✓ No ___ Depth (inches): 2

Water Table Present? Yes ___ No ✓ Depth (inches): ___

Saturation Present? (includes capillary fringe) Yes ___ No ✓ Depth (inches): ___

Wetland Hydrology Present? Yes ✓ No ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Creekside Village City/County: El Dorado County Sampling Date: 1/13/21

Applicant/Owner: Winn Communities State: CA Sampling Point: DP-20

Investigator(s): Joshua Boldt Section, Township, Range: _____

Landform (hillslope, terrace, etc.): _____ Local relief (concave, convex, none): _____ Slope (%): _____

Subregion (LRR): C - Mediterranean California Lat: _____ Long: _____ Datum: _____

Soil Map Unit Name: _____ NWI classification: _____

Are climatic / hydrologic conditions on the site typical for this time of year? Yes _____ No ✓ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes _____	No ✓	**Is the Sampled Area within a Wetland?** Yes _____ No ✓
Hydric Soil Present?	Yes _____	No ✓	
Wetland Hydrology Present?	Yes _____	No ✓	

Remarks:

Climatic/hydrologic conditions were not typical as the 2020-2021 wet season was drier than normal. The PDSI for the study area was categorized as "severe drought".

VEGETATION – Use scientific names of plants.

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ___ No ✓ Depth (inches): _____

Water Table Present? Yes ___ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes ___ No ✓ Depth (inches): _____

Wetland Hydrology Present? Yes ___ No ✓

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Creekside Village City/County: El Dorado County Sampling Date: 1/13/21

Applicant/Owner: Winn Communities State: CA Sampling Point: DP-28

Investigator(s): Joshua Boldt Section, Township, Range: _____

Landform (hillslope, terrace, etc.): _____ Local relief (concave, convex, none): _____ Slope (%): _____

Subregion (LRR): C - Mediterranean California Lat: _____ Long: _____ Datum: _____

Soil Map Unit Name: _____ NWI classification: _____

Are climatic / hydrologic conditions on the site typical for this time of year? Yes _____ No ✓ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ✓ No _____	**Is the Sampled Area within a Wetland?** Yes ✓ No _____
Hydric Soil Present?	Yes ✓ No _____	
Wetland Hydrology Present?	Yes ✓ No _____	

Remarks:

Climatic/hydrologic conditions were not typical as the 2020-2021 wet season was drier than normal. The PDSI for the study area was categorized as "severe drought". Feature is hillside seep.

VEGETATION – Use scientific names of plants.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes _____ No ✓ Depth (inches): _____

Water Table Present? Yes _____ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No ✓ Depth (inches): _____

Wetland Hydrology Present? Yes _____ No ✓

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Creekside Village City/County: El Dorado County Sampling Date: 1/13/21
Applicant/Owner: Winn Communities State: CA Sampling Point: DP-37
Investigator(s): Joshua Boldt Section, Township, Range: _____
Landform (hillslope, terrace, etc.): _____ Local relief (concave, convex, none): _____ Slope (%): _____
Subregion (LRR): C - Mediterranean California Lat: _____ Long: _____ Datum: _____
Soil Map Unit Name: _____ NWI classification: _____
Are climatic / hydrologic conditions on the site typical for this time of year? Yes _____ No ✓ (If no, explain in Remarks.)
Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____
Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ✓	No _____	**Is the Sampled Area within a Wetland?** Yes _____ No ✓
Hydric Soil Present?	Yes _____	No ✓	
Wetland Hydrology Present?	Yes _____	No ✓	

Remarks:
Climatic/hydrologic conditions were not typical as the 2020-2021 wet season was drier than normal. The PDSI for the study area was categorized as "severe drought".

VEGETATION – Use scientific names of plants.

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) **(Riverine)**
- ___ Sediment Deposits (B2) **(Riverine)**
- ___ Drift Deposits (B3) **(Riverine)**
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes _____ No ✓ Depth (inches): _____

Water Table Present? Yes _____ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No ✓ Depth (inches): _____

Wetland Hydrology Present? Yes _____ No ✓

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Creekside Village City/County: El Dorado County Sampling Date: 1/13/21
Applicant/Owner: Winn Communities State: CA Sampling Point: DP-41
Investigator(s): Joshua Boldt Section, Township, Range: _____
Landform (hillslope, terrace, etc.): _____ Local relief (concave, convex, none): _____ Slope (%): _____
Subregion (LRR): C - Mediterranean California Lat: _____ Long: _____ Datum: _____
Soil Map Unit Name: _____ NWI classification: _____
Are climatic / hydrologic conditions on the site typical for this time of year? Yes _____ No ✓ (If no, explain in Remarks.)
Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____
Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ✓ No _____	**Is the Sampled Area within a Wetland?** Yes ✓ No _____
Hydric Soil Present?	Yes ✓ No _____	
Wetland Hydrology Present?	Yes ✓ No _____	

Remarks:
Climatic/hydrologic conditions were not typical as the 2020-2021 wet season was drier than normal. The PDSI for the study area was categorized as "severe drought". Feature is hillside seep.

VEGETATION – Use scientific names of plants.

Subregion (LRR): C - Mediterranean California Lat: Long: Datum:
Soil Map Unit Name: NWI classification:
Are climatic / hydrologic conditions on the site typical for this time of year? Yes ____ No ✓ (If no, explain in Remarks.)
Are Vegetation ____, Soil ____, or Hydrology ____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No ____
Are Vegetation ____, Soil ____, or Hydrology ____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ✓ No ____	**Is the Sampled Area within a Wetland?** Yes ✓ No ____
Hydric Soil Present?	Yes ✓ No ____	
Wetland Hydrology Present?	Yes ✓ No ____	

Remarks:
Climatic/hydrologic conditions were not typical as the 2020-2021 wet season was drier than normal. The PDSI for the study area was categorized as "severe drought". Feature is riparian wetland associated with perennial creek.

VEGETATION – Use scientific names of plants.

	Absolute % Cover	Dominant Species?	Indicator Status
Tree Stratum (Plot size: ____)			
1. Salix gooddingii	25	Yes	FACW
2.			
3.

Dominance Test worksheet:
Number of Dominant Species That Are OBL, FACW, or FAC: 4 (A)
Total Number of Dominant Species Across All Strata: 4 (B)
Percent of Dominant Species That Are OBL, FACW, or FAC: 100 (A/B)

Prevalence Index worksheet:

Total % Cover of:		Multiply by:	
OBL species	10	x 1 =	10
FACW species	25	x 2 =	50
FAC species	45	x 3 =	135
FACU species	0	x 4 =	0
UPL species	0	x 5 =	0
Column Totals:	80 (A)		195 (B)

Prevalence Index = B/A = 2.4375

Hydrophytic Vegetation Indicators:
✓ Dominance Test is >50%
✓ Prevalence Index is ≤3.0[1]
___ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)
___ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes ✓ No ____

Remarks:

SOIL

Sampling Point: DP-45

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	%	Redox Features Color (moist)	%	Type[1]	Loc[2]	Texture	Remarks
0-8	10 YR 4/1	85	7.5 YR 4/6	15	C	M	clay loam	

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ Stratified Layers (A5) (**LRR C**)
- ___ 1 cm Muck (A9) (**LRR D**)
- ___ Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)
- ___ Sandy Mucky Mineral (S1)
- ___ Sandy Gleyed Matrix (S4)
- ___ Sandy Redox (S5)
- ___ Stripped Matrix (S6)
- ___ Loamy Mucky Mineral (F1)
- ___ Loamy Gleyed Matrix (F2)
- ✓ Depleted Matrix (F3)
- ___ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes ✓ No ___

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ___ No ✓ Depth (inches): _____

Water Table Present? Yes ✓ No ___ Depth (inches): 3

Saturation Present? (includes capillary fringe) Yes ✓ No ___ Depth (inches): surface

Wetland Hydrology Present? Yes ✓ No ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

1.0 INTRODUCTION

This report presents the results of an oak resources survey conducted for the ±240-acre Creekside Village (aka DST Property) site (Study Area) located within El Dorado County, California. The purpose of this report is to present information on the species, size, and condition of protected oak trees on the site, map the extent and location of oak woodland, provide an analysis of potential impacts to oak resources from the proposed project, provide mitigation requirements consistent with the County of El Dorado Oak Resources Management Plan, and tree protection recommendations for trees to be preserved onsite.

The Study Area is located along and west of Latrobe Road, approximately three air miles south of U.S. Route 50, El Dorado County, California, within Sections 24 and 25 of Township 9 North, Range 8 East of the *Folsom SE* US Geological (USGS) quadrangle. The approximate location of the center of the Study Area is 38° 36' 45.123" North, 121° 3' 2.532" West (**Figure 1**).

The proposed project will construct a residential development with approximately 99 acres of low-density housing, 30.5 acres of medium-density housing, and five acres of high-density housing. Additionally, three parks, totaling approximately eight acres, and approximately 44 acres of open space are proposed.

2.0 OAK RESOURCES MANAGEMENT PLAN

The County of El Dorado (County) adopted the *El Dorado County Oak Resources Management Plan* (ORMP) on October 24, 2017 and the ORMP went into effect on November 23, 2017. The ORMP designates three classes of protected oak resources: oak woodlands, Heritage oak trees, and individual native oak trees. According to the ORMP, there are six primary native oak tree species in El Dorado County, which include blue oak (*Quercus douglasii*), interior live oak (*Quercus wislizeni*), valley oak (*Quercus lobata*), California black oak (*Quercus kelloggii*), canyon live oak (*Quercus chrysolepis*), and Oregon oak (*Quercus garryana*). Additionally, one hybrid, known as oracle oak (*Quercus* x *morehus*) also occurs within the County. These species comprise the County's oak woodlands and also occur as isolated individual trees or small groups of trees. Woodland habitats include biological communities that range in structure and density. Major oak woodland habitats within El Dorado County include blue oak-foothill pine, blue oak woodland, montane hardwood, montane hardwood-conifer, and valley oak woodland. Additionally, any oak stand that either currently or historically supports a greater than 10 percent oak canopy cover is considered an oak woodland, even if it is located within a larger non-woodland habitat.

A Heritage tree is a protected oak tree that has a single main trunk that measures 36 inches diameter at breast height (DBH) or greater, or a multiple trunk with an aggregate DBH measuring 36 inches or greater. Trees of this size are regulated individually whether located within or outside of an oak woodland. An individual oak tree located outside of an oak woodland is regulated under the ORMP if it has a single main trunk that measures greater than six inches in DBH as measured at four feet six inches from the ground, or a multiple trunk with an aggregate DBH measuring greater than ten inches in DBH and is not a Heritage tree.

A permit is required prior to impacting or removing protected oak resources. Impacts to oak trees include pruning, grading within the root zone, or any other disturbance to the tree. Oak woodland is considered impacted by any development activity, such as clearing, grading, and other modifications for roads, buildings, landscaping, or other development activities.

Mitigation is required for impacts to protected oak resources. Mitigation for individual oak trees is based on an inch-for-inch basis; Heritage tree replacement is required at a 3:1 ratio. Oak woodland mitigation requirements depend on the percentage of oak woodland impacted as follows: 1:1 replacement of canopy acreage, where 50 percent or less of on-site oak woodlands are impacted; 1.5:1 replacement of acreage, where 50.1 to 75 percent of on-site oak woodlands are impacted; and 2:1 replacement of acreage, where 75.1 to 100 percent of on-site oak woodlands are impacted. Additionally, a conservation easement or deed restriction must be placed over any retained on-site woodlands to protect them in perpetuity.

Mitigation under the ORMP may be completed with a combination of the following options: on- or off-site replacement plantings, payment of in-lieu fees, or establishment of an off-site conservation easement for oak woodlands only. Payment of in-lieu fees are currently set at $8,285 per acre for oak woodlands, $153 per trunk inch for individual trees, and $459 per trunk

inch for Heritage trees. Replacement planting is limited to 50 percent of the total required mitigation. Various plant sizes may be used in mitigation planting, as shown in **Table 1**, below.

TABLE 1 — MITIGATION TREE REPLACEMENT RATIOS

Replacement Tree Size	# of Trees Required
Oak Woodland	
1-gallon / TreePot 4	1 per tree required*
Acorn	3 per tree required*
Individual / Heritage Trees	
15-gallon	1 per inch removed
5-gallon	1.5 per inch removed (rounded up)
1-gallon / TreePot 4	2 per inch removed
Acorn	3 per inch removed

* Number of trees required based on actual density of trees removed

Mitigation planting density is based on the actual tree density of the oak woodland removed, with a maximum planting density of 200 trees per acre. All mitigation trees shall be maintained and monitored for a period of seven years following the initial planting. Overplanting is acceptable in order to achieve the required density and acreage at the end of the 7-year monitoring period. If mitigation planting is implemented then a Replacement Planting Plan is required and the planting area must be protected in perpetuity through deed restrictions or a conservation easement.

3.0 METHODOLOGY

The Study Area was surveyed by International Society of Arboriculture (ISA) Certified Arborist, Zachary Neider (WE-11615A) on September 25, 2018. All oak resources within and overhanging the project footprint were inventoried. A diameter tape was used to verify the DBH of each inventoried tree. The measurement from the trunk to the end of the longest lateral limb was estimated, and used as the dripline radius (DLR). All surveyed trees were identified with an aluminum tag that corresponds to the numbering in **Appendix A**. Approximate tree locations were mapped using a Trimble GeoXT Global Positioning System (GPS) hand-held unit with sub-meter accuracy. Tree data was combined with habitat data developed by aerial photo interpretation and field observations in ArcGIS 10.4. Approximate oak tree locations, oak woodland habitat, and potential project impacts to oak resources are identified in **Figure 2.**

The health and structural condition of each tree was rated according to **Table 2,** below. The health rating considers factors such as the size, color, and density of the foliage; the amount of deadwood within the canopy; bud viability; evidence of wound closure; and the presence or evidence of stress, disease, nutrient deficiency, and insect infestation. The structural rating reflects the trunk and branch configuration; canopy balance; the presence of included bark and other structural defects such as decay; and the potential for structural failure. In cases where conditions fall between the Good, Fair, and Poor ratings, intermediate ratings Fair-Good and Poor-Fair were used.

TABLE 2 — TREE RATING SYSTEM

Rating	Tree Health
Good	There is an average or below-average amount of deadwood/dieback with respect to the tree's size and growing environment; leaf size, color, and density are typical for the species; buds are normal size, viable, abundant, and uniform throughout the canopy; current and past growth increments are generally average or better; any callusing is vigorous. This health rating indicates that there is very little, if any, evidence of stress, disease, nutrient deficiency, and/or insect infestation.
Fair	There is an above-average amount of deadwood/dieback with respect to the tree's size and growing environment; leaf size, color, and density may be below what is typically expected for the species; buds are normal size and viable, but slightly sparse throughout the canopy; current and past growth increments may be below average; tree may be slow to callus around old wounds. This health rating indicates that there is moderate evidence of stress, disease, nutrient deficiency, and/or insect infestation.
Poor	There is an extreme amount of deadwood/dieback with respect to the tree's size and growing environment; leaf size, color, and density are clearly compromised; very few viable buds are present throughout the canopy; current and past growth increments are meager; no evidence of callusing around old wounds. This health rating indicates that there is widespread evidence of stress, disease, nutrient deficiency, and/or insect infestation.

Rating	Tree Structure
Good	No wounds, cavities, decay, or indication of hollowness are evident in the root crown, trunk, or primary and secondary limbs; no anchor roots are exposed; no codominant branching or multiple trunk attachments are present; very little included bark at branch attachments exists; no dead primary or secondary limbs are present in canopy; there have been no major limb failures; limbs are not overburdened; branching structure is appropriate for species; any decay is limited to small dead branches/stubs. This structure rating represents a low potential for failure.
Fair	With respect to the size of the tree, small to moderate wounds, cavities, decay, and indication of hollowness may be evident in the root crown, trunk, and/or primary and secondary limbs; some anchor roots may be exposed; codominant branching or multiple trunk attachments may be present, but included bark does not exist or is not well developed; minor to moderate amounts of included bark at branch attachments may exist; there may be small to moderate amounts of large dead limbs in canopy, but there is no evidence of large limb failures; limbs may be slightly overburdened; branching structure and/or canopy balance may be moderately altered by the tree's growing environment. This structure rating represents a moderate potential for failure.
Poor	With respect to the size of the tree, significant wounds, cavities, decay, and/or indication of hollowness may be evident in the root crown, trunk, and/or primary and secondary limbs; anchor roots may be exposed and/or the tree may have lost anchorage; codominant branching or multiple trunk attachments may be present; significant amounts of included bark may exist in trunk and branch attachments; there may be significant amounts of large dead limbs in the canopy; there may be evidence of trunk or large limb failures; limbs may be severely overburdened; branching structure and/or canopy balance may be drastically altered by the tree's growing environment. This structure rating represents a high potential for failure.

4.0 RESULTS AND DISCUSSION

The Study Area contains approximately 0.96 acres of blue oak woodland habitat (**Figure 2**). This particular biological community is characterized by an overstory composed of exclusively blue oak. The herbaceous understory consists of species such as wild oat (*Avena fatua*), medusahead (*Elymus caput-medusae*), vetch (*Vicia sativa*), Italian thistle (*Carduus pycnocephalus* ssp. *pycnocephalus*), and prickly lettuce (*Lactuca serriola*).

A total of seven oak trees, all Heritage blue oaks, were surveyed. Two trees (#1295 and #1296) were rated as Fair or better for both health and structure, two trees (#1297 and #1300) were rated as having Poor-Fair health, but Fair structure, and the remaining three trees fell below the Fair category in both health and structure. The majority of the inventoried trees are overmature and in decline in regards to health and structure, with common issues in trees of that age such as trunk wounds, rot, dieback, sloughing bark, and broken limbs. Detailed tree data for all surveyed trees is included in **Appendix A**.

5.0 OAK RESOURCE IMPACTS AND MITIGATION

Winn Communities is responsible for implementation of mitigation, if applicable. All oak resources within the Study Area exist within a portion of the proposed open space (**Figure 2**). Therefore, the project is expected to avoid impacts to all oak resources. Best management practices (BMP's), as described in **Section 6.0**, should be implemented for the duration of construction to ensure that existing oak resources are not inadvertently impacted by construction activities. Because the project will avoid all oak resources, no mitigation for individual oak trees, Heritage trees, or oak woodland is expected to be required.

6.0 TREE PROTECTION MEASURES

Although the existing oak resources are located in open space areas and no impacts are anticipated, if site improvements occur within 50 feet of the oak trees, the following BMP's should be integrated into the project plans to avoid impacts to protected oak resources within the Study Area:

- Install Tree Protection Fencing, consisting of a minimum 4-foot tall high-visibility fence (orange plastic snow fence or similar) on steel posts placed a maximum of 8-feet on center, shall be placed at the edge of the woodland habitat and around the perimeter of the root protection zone (RPZ) (dripline radius x 1.3) for the trees to remain, whichever is greater. The RPZ is the minimum distance for placing protective fencing, but tree protection fencing should be placed as far outside of the RPZ as possible. Signs shall be placed along the fence at approximately 50-foot intervals. Each sign shall be a minimum of 2 feet by 2 feet and shall include the following:

  TREE PROTECTION ZONE
  DO NOT MOVE OR RELOCATE FENCE
  UNTIL PROJECT COMPLETION WITHOUT
  PERMISSION OF PROJECT ARBORIST
  OR EL DORADO COUNTY

- If permanent site improvements (e.g. paving, buildings, and structures) encroach into the protected area, install fence at limit of work. If temporary impacts (e.g. grading, utility installation) require encroachment into the protected area, move fence to limit of work during active construction of item and return to edge of protected area once work is completed.
- Protection fencing shall not be moved without prior authorization from the Project Arborist or County of El Dorado or as detailed on approved plans.
- Avoid paving within protected area. If paving cannot be avoided, porous materials will be used.
- No parking, portable toilets, dumping or storage of any construction materials, including oil, gas, or other chemicals, or other infringement by workers or domesticated animals is allowed in the protected area.
- No signs, ropes, cables, metal stakes, or any other items shall be attached to a protected tree, unless recommended by an ISA-Certified Arborist.
- Grading, excavation, or trenching within the tree protection zone (TPZ) of existing native oaks should be avoided to the greatest extent possible. Under no circumstances should fill soil be placed against the trunk of an existing tree.
- Underground utilities should be avoided in the TPZ, but if necessary shall be bored or drilled. No trenching is allowed within the TPZ unless specifically approved by the Project Arborist.

- Drains shall be installed according to County specifications to avoid harm to existing oak trees due to excess watering.
- Pruning of living limbs or roots shall be done under the supervision of an ISA-Certified Arborist. All pruning should be done by hand, air knife, or water jet, in accordance with ISA standards using tree maintenance best practices. Climbing spikes should not be used on living trees. Limbs should be removed with clean cuts just outside the crown collar.
- Cover exposed roots or cut root ends in trenches with damp burlap to prevent drying out.
- Minimize disturbance to the native ground surface (grass, leaf, litter, or mulch) under preserved trees to the greatest extent feasible.
- Native woody plant material (trees and shrubs to be removed) may be chipped or mulched on site and placed in a 4 to 6-inch deep layer around existing trees to remain. Do not place mulch in contact with the trunk of preserved trees.
- Deep water preserved trees that have had roots cut during project activities once a month throughout the summer as needed or as recommended by the Project Arborist.
- Appropriate fire prevention techniques shall be employed around all trees to be preserved. This includes cutting tall grass, removing flammable debris within the TPZ, and prohibiting the use of tools that may cause sparks, such as metal-bladed trimmers or mowers.
- No open flames shall be permitted within 15 feet of the tree canopy.
- Damage to any protected tree during construction shall be immediately reported to County of El Dorado Planning Services. Damage shall be corrected as required by the County representative.

OAK RESOURCES TECHNICAL REPORT CHECKLIST

The following information is required for all Oak Resources Technical Reports consistent with Section 2.5 (Oak Resources Technical Reports) of the Oak Resources Management Plan (ORMP):

FORMS AND MAPS REQUIRED

Place a check (√) on the "Applicant" lines for those items completed. The planner receiving the application will check (√) the "County" line.

Check (√) Applicant	County	
☑	☐	1) Identify, locate, and quantify all oak resources on the property, as applicable:

a) Oak woodlands shall be mapped and assessed in accordance with the CDFG 2009 *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* and subsequent updates, and the *List of Vegetation Alliances and Associations* (CDFG 2010) and subsequent updates;

b) Data collected for individual native oak trees and Heritage Trees shall include: location, species, trunk diameter (dbh), height, canopy radius, and general health and structural condition.

☑	☐	2) Identify and quantify project-related impacts to oak resources
☑	☐	3) Measures identifying how specific trees and woodlands (or retained portions thereof) shall be protected during development and related work

Check (√) Applicant	County		
☒ n/a	☐	4)	Proposed actions to mitigate impacts to oak resources, consistent with the requirements included in the ORMP:

a) For replacement planting, the report shall provide detail regarding the quantity, location, planting density, replacement tree size(s), and acorn/seedling source consistent with the definition of Replacement Planting included in the ORMP;

b) For conservation easement placement/acquisition and/or land acquisition in fee title, the report shall provide documentation of easement placement on-site and/or documentation of easement or land acquisition off-site to the satisfaction of the County;

c) For in-lieu fee payment, the report shall document the quantity of impacts (acreage of oak woodlands and/or total diameter inches of individual native oak trees/Heritage Trees) and the total in-lieu fee payment necessary (presented separately for oak woodlands, individual native oak trees, and Heritage Trees, where applicable).

☑	☐	5)	Identification of responsible parties
☒ n/a	☐	6)	Identification of maintenance, monitoring, and reporting requirements
☒ n/a	☐	7)	Analysis of non-PCA conservation easement areas, where applicable
☑	☐	8)	Site map(s) depicting:

a) location of all oak woodlands, individual native oak trees, and Heritage Trees;

b) location of all proposed project-related improvements (including, but not limited to, the limits of grading, fuel modification/defensible space areas, and above- and below-ground infrastructure);

c) Site map(s) shall also clearly identify impacted oak resources.

☑	☐	9)	Planning and Building Department Summary Data Sheet of Oak Resources Impacts for Oak Tree/Oak Woodland Removal Permits.

SUPPLEMENTAL DATA FOR INDIVIDUAL NATIVE OAK TREES WITHIN OAK WOODLANDS:

The ORMP and Oak Resources Conservation Ordinance (No. 5061) was adopted on October 24, 2017 and the Board of Supervisors will review implementation within 12 months after adoption. The Board requested the following supplemental information:

☒ n/a	☐	10)	Provide an inventory (species and size) of impacted Individual Native Oak Trees greater than 24 inches and less than 36 inches (dbh) in oak woodlands.

COMMUNITY DEVELOPMENT SERVICES
PLANNING AND BUILDING DEPARTMENT

Subject: Oak Resources Technical Report Update for the Creekside Village Project, El Dorado County, California.

Dear Tony:

In September 2018, an International Society of Arboriculture (ISA) Certified Arborist from Foothill Associates conducted a survey of oak resources at the Creekside Village project site in El Dorado County, California. The results are documented in an *Oak Resource Technical Report* dated January 4, 2019. The report documents the oak tree locations, tree size and health, potential impacts, mitigation options required by the El Dorado County *Oak Resources Management Plan* (ORMP), and tree protection recommendations for trees preserved onsite. At the time the 2019 report was prepared, no impacts to oak resources were anticipated as part of project development. This *Oak Resources Technical Report Update* summarizes the findings of an updated survey of the oak trees on the project site. This report includes updates to the tree sizes, health conditions, and potential impacts.

The Creekside Village project is located along the west side of Latrobe Road, approximately three air miles south of Highway 50 (**Figure 1**). Habitat on the project site primarily consists of annual grassland with scattered seasonal wetlands and ephemeral drainages. A creek flows east to west through the northern portion of the project site. Blue oak woodland occurs in the southeast corner, near the intersection of Latrobe Road and Wetsel-Oviatt Road. The project proposes to construct a residential development with a mix of low and medium density housing.

El Dorado County Oak Resources Management Plan

As described in the 2019 Foothills Associates report, the El Dorado County ORMP was adopted on October 24, 2017. The ORMP regulates and defines mitigation requirements for impacts to oak woodlands, individual native oak trees, and heritage trees on privately-owned lands within the unincorporated area of the County at or below 4,000 feet elevation. The policy of the County is to preserve oak woodlands when feasible, through the review of all proposed development activities where woodlands are present, while at the same time recognizing individual rights to develop private property in a reasonable manner. As such, the County requires mitigation for impacts to oak woodlands and requires a permit prior to removal.

Oak woodlands are defined as "an oak stand with greater than ten percent canopy cover or that may have historically supported greater than ten percent canopy cover." Native oak trees comprising El Dorado County's oak woodlands are blue oak (*Quercus douglasii*), valley oak (*Q. lobata*), California black oak (*Q. kelloggii*), interior live oak (*Q. wislizeni*), canyon live oak (*Q. chrysolepis*), Oregon oak (*Q. garryana*), and oracle oak (*Quercus x morehus*) which is a native hybrid between California black oak and interior live oak. A heritage tree

ESA

is defined as a live native oak tree with a single main trunk 36 inches diameter at breast height (DBH) or greater, or with a multiple trunk with an aggregate DBH 36 inches or greater. Individual native oak trees consist of any live native oak tree with a single main trunk greater than six inches DBH, or with a multiple trunk with an aggregate trunk DBH greater than 10 inches and is not a heritage tree.

The ORMP requires mitigation for permitted oak tree removal. To encourage on-site retention of oak woodlands, the ORMP requires increasing mitigation ratios based on the amount of oak woodland removed. Removing 50 percent or less requires a 1-to-1 ratio of mitigation, removing up to 75 percent requires a 1.5-to-1 ratio of mitigation, and removing up to 100 percent requires a 2-to-1 ratio of mitigation. A deed restriction or conservation easement is required to be placed over any retained on-site woodlands and those woodlands retained on site shall not be counted towards the impacted amount or towards the required mitigation. Mitigation for impacted oak woodlands shall occur at the required ratio using one or more of the following options:

1. Off-site deed restriction or conservation easement acquisition and/or acquisition in fee title by a land conservation organization for purposes of off-site oak woodland conservation;

2. In-lieu fee payment to be either used by the County to acquire off-site deed restrictions and/or conservation easements or to be given by the County to a land conservation organization to acquire off-site deed restrictions and/or conservation easements;

3. Replacement planting on-site within an area subject to a deed restriction or conservation easement;

4. Replacement planting off-site within an area subject to a conservation easement; or

5. A combination of numbers 1 through 4 above.

Mitigation for removal of heritage trees is based on an inch for inch replacement standard at a 3-to-1 ratio. Mitigation options for impacts to heritage trees and individual native oak trees consist of the following:

1. Replacement planting on-site within an area subject to a deed restriction or conservation easement;

2. Replacement planting off-site within an area subject to a conservation easement or acquisition in fee title by a land conservation organization;

3. In-lieu fee payment to be either used by the County to plant oak trees or to be given by the County to a land conservation organization to plant oak trees; or

4. A combination of numbers 1 through 3 above.

A security deposit is required for all discretionary projects proposing on-site oak tree/oak woodland retention and/or replacement planting as mitigation. No grading or other on-site work shall be permitted until the security deposit is posted. Additionally, replacement planting may not account for more than 50 percent of the mitigation requirement.

ESA

The ORMP provides an exemption to mitigation for removal of dead, dying, or diseased native oak trees. This exemption applies when the tree is documented as dead, dying, or diseased in writing by a Certified Arborist or Registered Professional Forester; and/or when the tree exhibits high failure potential with the potential to injure persons or damage property and documented in writing by a Certified Arborist or Registered Professional Forester.

The current in-lieu fee for removal of oak woodlands is calculated based on total cost per acre which is currently set at $8,285. The in-lieu fee for removal of individual oak trees is calculated on a total cost per inch which is currently set at $153 for a non-heritage tree and $459 per inch for a heritage tree at a 3-to-1 ratio. The per-inch fee shall be multiplied by the total number of trunk diameter inches removed. The in-lieu fees collected will be deposited in the County's Oak Woodland Conservation Fund. That fund will be used to acquire land and/or conservation easements to conserve oak woodlands, provide for native oak tree planting, and for ongoing conservation area monitoring and management activities.

Methods

ESA's ISA Certified Arborist and Tree Risk Assessment Qualified, Jessica Orsolini (ISA No. WE-7845A) conducted a survey of the oak trees on November 6, 2024. All oak trees on the project site and oak trees with canopies overhanging the project site were surveyed. The location of each tree was recorded using Geographic Positioning System (GPS) technology. Trees were numbered consistent with their numbering from the Foothill survey. No new or additional tags were placed on the trees. The boundary of the blue oak woodland was refined to more accurately represent the outer edge of the oak tree canopy and distinguish individual oak trees per the ORMP. The Project site, inventoried trees, and blue oak woodland are shown in **Figure 2**.

The DBH of each tree was measured using a diameter tape. The height of each tree was visually estimated; the dripline was estimated by pacing out the distance on the ground below the canopy. The health and structural condition of each tree was assessed and rated. Tree health was rated based on the tree's vigor, crown density and dieback, leaf color and size, defects, disease, and evidence of wound closure (callusing). Structural health was rated based on the tree's structural stability and failure potential based on the presence of co-dominant trunks, included bark, branch configuration, decay, abnormal lean, one-sided canopy, and history of failure.

The health and structure of each tree was assigned to one of six categories for tree condition. The six categories were good (G; no defects or minor defects), fair to good (F-G; defects), fair (F; more serious defects), fair to poor (F-P; severe or compounding defects), and poor (P; severe or compounding defects, and short-term death or structural failure of the tree is expected). Condition was judged based on an external inspection of each tree from the ground.

Results and Discussion

The survey for this *Oak Resources Technical Report Update* included the same seven blue oak trees that were surveyed for the 2019 *Oak Resources Technical Report* conducted by Foothill Associates. One additional blue oak not included in the 2019 report was added for this report update (numbered 0000). The added oak tree is rooted on a parcel to the south but overhangs the project site. The refined blue oak woodland boundary totals 0.45 acre. The two blue oaks located along the southern property line are not part of the oak woodland but are considered individual oaks per the ORMP. The results of the tree survey are in the table in **Attachment A**.

ESA

Of the seven trees surveyed for the 2019 report, one (tree number 1298) is now dead and has fallen over. Four of the trees surveyed have DBH's of 36 inches or greater, qualifying them as heritage trees under the ORMP (tree numbers 1294, 1295, 1296, and 1300). Of the remaining seven standing trees surveyed, three have a fair health condition, two have a fair-poor health condition, and two have a poor health condition. Structural ratings also range from fair to fair-poor to poor condition. As noted in the 2019 report, all the trees are overmature and in decline. Most have a history of medium to large branch failure and over half (four) have substantial rot in the main trunk.

Impacts and Mitigation

Project construction impacting oak trees consists of construction of a graded slope at the back of houses and installation of a walking path. Construction to create the slope area will require the removal of two blue oak trees (Trees 1295 and 1300), both of which are heritage trees (**Figure 2**). The proposed new walking path crosses through the area of Tree 1298, a non-heritage blue oak tree, however this tree has died and fallen over. Removal of dead trees does not require mitigation.

Prior to project construction, the project proponent must obtain a tree removal permit and mitigate in accordance with the ORMP. The project proponent proposes payment of the in-lieu fee to satisfy the mitigation requirements. Mitigation for removal of heritage trees is based on an inch for inch replacement standard at a 3-to-1 ratio. The in-lieu fee for removal of heritage trees is $459 per inch (3-to-1 ratio of the standard inch cost of $153). Removal of Trees 1295 and 1300 will require payment of $34,425. **Table 1** shows the required mitigation. No other heritage oaks, individual oaks, or oak woodlands will be removed as a result project construction. In accordance with the ORMP, a deed restriction or conservation easement will be placed over the retained on-site woodlands. Tree protection measures specified in the 2019 *Oak Resource Technical Report* will be implemented for oak resources not removed by the project.

TABLE 1
SUMMARY OF OAK TREE REMOVAL MITIGATION REQUIREMENTS

Tree #	Species	DBH (inches)	In-Lieu Fee per Inch	Mitigation Ratio	Total Mitigation Required
1295	Blue oak	39	$153	3:1	$17,901
1298	Blue oak	N/A – DEAD/ FALLEN OVER	N/A - DEAD/ FALLEN OVER	N/A - DEAD/ FALLEN OVER	N/A - DEAD/ FALLEN OVER
1300	Blue oak	36	$153	3:1	$16,524
				Grand Total	**$34,425**

ESA

The El Dorado County Oak Resources Technical Report Checklist is included as **Attachment B** and the El Dorado County Community Development Services Summary Data Sheet of Oak Resources Impacts for Oak Tree/Oak Woodland Removal Permits is included at **Attachment C**.

We appreciate the opportunity to provide arborist services for the Creekside Village Project. Please contact me with any questions or comments.

Sincerely,

Jessica Orsolini
Senior Biologist/ ISA Certified Arborist #WE-7845A

ATTACHMENT A
2024 OAK TREE SURVEY DATA

Tree #	Species	DBH (inches)	Dripline (feet)	Height (feet)	Health	Structure	Heritage Tree [a] (Yes/No)	Removed (Yes/No)	Notes
1294	Blue oak	43	38	45	Fair	Fair	Yes	No	Located on property line. Barbwire fence growing through trunk. 1- to 4-inch dead branches particularly in lower canopy, some broken. Bulge in trunk at base.
1295	Blue oak	39	24	50	Fair	Fair-Poor	Yes	Yes	No tree tag present. Canopy dieback. 1- to 5-inch dead branches, some broken (old breaks of 12- and 10-inch branches); fungus fruiting body at old branch break; 7-foot-long open wound with rot in trunk; several large live branches laying on ground though not broken.
1296	Blue oak	41.5	35	45	Fair-Poor	Poor	Yes	No	No tree tag present. Recent break of 12-inch branch. Substantial rot in trunk. Honeybees using rotted center. Torsion crack in trunk with trunk lean. Many 4- to 8-inch dead branches in canopy, many broken. Thinning canopy. Swing attached to large branch.
1297	Blue oak	33	30	40	Fair-Poor	Poor	No	No	No tree tag present. Large trunk wound; hollow; numerous dead broken branches in canopy 4- to 8-inches diameter; one-sided canopy due to adjacent tree.
1298	Blue oak	N/A	N/A	N/A	Dead	Dead	No	N/A	Dead and fallen over.
1299	Blue oak	31	25	25	Poor	Poor	No	No	13-inch branch comprising half the canopy broke off, small dead branches in remaining canopy; 5- and 8-inch broken and rotted branches; 6-foot-long open trunk wound with rot likely from prior codominant trunk failure.
1300	Blue oak	36	24	35	Poor	Fair-Poor	Yes	Yes	Substantial dieback and thinning canopy. Many 2- to 4-inch dead branches. Several small wounds at trunk base with rot present.
0000	Blue oak	26	18	34	Fair	Fair	No	No	Tree offsite with limb overhanging project. DBH estimated. 1- to 2-inch dead branches throughout canopy, some old branch breaks.

SOURCE: ESA 2024

NOTES:

a. The El Dorado County *Oak Resources Management Plan* defines a heritage tree as a live native oak tree with a single main trunk 36 inches DBH or greater, or with a multiple trunk with an aggregate DBH 36 inches or greater.

OAK RESOURCES TECHNICAL REPORT CHECKLIST

The following information is required for all Oak Resources Technical Reports consistent with Section 2.5 (Oak Resources Technical Reports) of the Oak Resources Management Plan (ORMP):

FORMS AND MAPS REQUIRED

Place a check (√) on the "Applicant" lines for those items completed. The planner receiving the application will check (√) the "County" line.

Check (√) Applicant	County	
☑	☐	1) Identify, locate, and quantify all oak resources on the property, as applicable:

a) Oak woodlands shall be mapped and assessed in accordance with the CDFG 2009 *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* and subsequent updates, and the *List of Vegetation Alliances and Associations* (CDFG 2010) and subsequent updates;

b) Data collected for individual native oak trees and Heritage Trees shall include: location, species, trunk diameter (dbh), height, canopy radius, and general health and structural condition.

☑	☐	2) Identify and quantify project-related impacts to oak resources
☑	☐	3) Measures identifying how specific trees and woodlands (or retained portions thereof) shall be protected during development and related work

Revised 11/22/2017

Check (√) Applicant	County		
☑	☐	4)	Proposed actions to mitigate impacts to oak resources, consistent with the requirements included in the ORMP:

a) For replacement planting, the report shall provide detail regarding the quantity, location, planting density, replacement tree size(s), and acorn/seedling source consistent with the definition of Replacement Planting included in the ORMP;

b) For conservation easement placement/acquisition and/or land acquisition in fee title, the report shall provide documentation of easement placement on-site and/or documentation of easement or land acquisition off-site to the satisfaction of the County;

c) For in-lieu fee payment, the report shall document the quantity of impacts (acreage of oak woodlands and/or total diameter inches of individual native oak trees/Heritage Trees) and the total in-lieu fee payment necessary (presented separately for oak woodlands, individual native oak trees, and Heritage Trees, where applicable).

☑	☐	5)	Identification of responsible parties
☒ N/A	☐	6)	Identification of maintenance, monitoring, and reporting requirements
☒ N/A	☐	7)	Analysis of non-PCA conservation easement areas, where applicable
☑	☐	8)	Site map(s) depicting:

a) location of all oak woodlands, individual native oak trees, and Heritage Trees;

b) location of all proposed project-related improvements (including, but not limited to, the limits of grading, fuel modification/defensible space areas, and above- and below-ground infrastructure);

c) Site map(s) shall also clearly identify impacted oak resources.

☑	☐	9)	Planning and Building Department Summary Data Sheet of Oak Resources Impacts for Oak Tree/Oak Woodland Removal Permits.

SUPPLEMENTAL DATA FOR INDIVIDUAL NATIVE OAK TREES WITHIN OAK WOODLANDS:

The ORMP and Oak Resources Conservation Ordinance (No. 5061) was adopted on October 24, 2017 and the Board of Supervisors will review implementation within 12 months after adoption. The Board requested the following supplemental information:

☒ N/A	☐	10)	Provide an inventory (species and size) of impacted Individual Native Oak Trees greater than 24 inches and less than 36 inches (dbh) in oak woodlands.

Revised 11/22/2017

Attention: Mr. Anthony Gon

Subject: **CREEKSIDE VILLAGE**
Latrobe Road, APN 117-010-012, El Dorado Hills, California
GEOTECHNICAL FEASIBILITY STUDY

Reference: Proposal and Executed Contract for Creekside Village, prepared by Youngdahl Consulting Group, Inc., dated 11 February 2020 (Proposal No. PE20-070).

Dear Mr. Gon:

In accordance with your authorization, Youngdahl Consulting Group, Inc. has performed a Geotechnical Feasibility Study for the project site located at APN 117-010-012 on Latrobe Road in El Dorado Hills, California. The purpose of this study was to address the feasibility, from a geotechnical standpoint, of constructing the proposed development. Our scope was limited to a site reconnaissance, review of available published archival geotechnical data, and preparation of this report per the referenced proposal.

Based upon our site reconnaissance and geotechnical data review, it is our opinion that the primary geotechnical issues to be addressed consist of excavations into bedrock and drainage related to the anticipated shallow bedrock conditions. Due to the non-uniform nature of soils, other geotechnical issues may become more apparent during grading operations which are not listed above. The descriptions, findings, and conclusions provided in this report are formulated as a whole; specific conclusions should not be derived or used out of context. Please review the limitations and uniformity of conditions section of this report.

This report has been prepared for the exclusive use of Winn Communities and their consultants, for specific application to this project, in accordance with generally accepted geotechnical engineering practice. Should you have any questions or require additional information, please contact our office at your convenience.

Very truly yours,
Youngdahl Consulting Group, Inc.

Kyle J. Martinez, P.E.

GEOTECHNICAL FEASIBILITY STUDY
FOR
CREEKSIDE VILLAGE

1.0 INTRODUCTION

This report presents the results of our Geotechnical Feasibility Study performed for the proposed residential housing development planned to be constructed at APN 117-010-012 on Latrobe Road in El Dorado Hills, California. Annotated vicinity and site maps are provided on attached Figures 1 and 2 to identify the approximate project location.

Purpose and Scope

The scope of work for the geotechnical feasibility study included an initial geotechnical site reconnaissance, review of available published and Youngdahl Consulting Group, Inc. archival geotechnical data for the approximate project area, and assessment of potential geotechnical constraints. The study is based, in part, upon information provided by the client.

The purpose of the geotechnical feasibility study was to assess the major geotechnical issues that could potentially affect the project, thus providing a framework for continued project planning. The intent of this report is to provide information regarding general site characteristics, including identification of any geotechnical characteristics that could constitute a constraint to the use of the land for the proposed residential development, and to provide guidance for a future geotechnical engineering study. This report is not intended to fulfill the criteria for geotechnical reports outlined in Chapter 18 of the 2019 California Building Code (CBC) or other jurisdictional requirements; investigations fulfilling those criteria will still need to be completed when the project reaches its appropriate stage. This report is intended to be used by the client in planning the project.

In the event that there are any changes in the proposed development concept, or if any of the assumptions used in the preparation of this report prove to be incorrect, the conclusions contained in this report shall not be considered valid unless the changes are reviewed and the conclusions of this report verified or modified by this firm in writing. The conclusions presented in this report are considered qualitative until such time as they are modified or verified by additional study such as that performed during a design-level geotechnical engineering investigation.

Project Understanding

We understand that Winn Communities is currently seeking entitlements for development of a future master planned community at the above referenced site. The planned community will likely consist of 700 to 800 residential units, a community gathering place, parks, trails, and open space. The residential units will likely consist of one to two-story wood framed structures, supported by conventional shallow foundations and slab-on-grade floors. Additional improvements will consist of asphalt and concrete roadways, sitework retaining walls, underground utilities, and pedestrian flatwork.

Background

Based on a limited review of aerial photography, the project site has remained undeveloped. If studies or plans pertaining to the site exist and are not cited as a reference in this report, we should be afforded the opportunity to review and modify our conclusions and recommendations as necessary.

2.0 SITE CONDITIONS

The following section describes our findings regarding the site conditions that we observed during our site reconnaissance, and the anticipated subsurface and groundwater conditions based upon our experience in the area.

Surface Observations

The project site is generally located on the west side of Latrobe Road in El Dorado Hills, California. Specifically, the area of development extends west from the southwest intersection of Avanti Drive and Latrobe Road to approximately 3000 feet southwest and as far south as the northwest intersection of Wetsel Oviatt Drive and Latrobe Road The site is bounded to the north by a commercial business park development, to the west by a new residential development, to the south by Wetsel-Oviatt Road, and the east by Latrobe Road fronting a large planned residential development eastward. The undeveloped site is approximately 174 acres in size, an irregularly shaped polygon, and generally slopes to the west.

The terrain consists of gently rolling hills with broad valleys and low gradient drainages and generally slopes toward the west at varying gradients with a maximum gradient of approximately 5H:1V (Horizontal:Vertical). The elevation ranges from a low of approximately 470 feet above mean sea level (AMSL) in the west to a maximum of 640 feet AMSL in the southeast. Occasional depressions and hills were observed throughout the site which appears to have served as mining prospect pits and springs. The vegetation throughout the project generally consisted of seasonal tall grasses with sparse trees and riparian type plants near the seasonal drainage courses.

These drainages cross the site and converge near the northwest corner of the site. Several near-vertical cut banks of the drainages were observed across the site. In general, the soils observed in cut banks were very steep to near vertical and extended to shallow bedrock in the streambed.

Shallow bedrock was observed across the site with numerous outcrops and “headstones” protruding out of the ground along the northeastern side of the project site. Most of the bedrock appears to be very moderately weathered to fresh in a moderately to widely spaced fractured condition.

Anticipated Subsurface Conditions

Our firm has performed several subsurface explorations near the vicinity of the project site. Based upon these explorations, we anticipate that the subsurface conditions will consist of soil overlying bedrock. The surface soils will likely entail silty clay and clayey silt in a soft to medium stiff condition. Underlying the soil, soft to hard metavolcanic bedrock in a highly to slightly weathered condition is expected. A thorough subsurface investigation is recommended once the project reaches its appropriate stage to more accurately determine the subsurface conditions.

Anticipated Groundwater Conditions

Based upon our review of the California Department of Water Resources website, permanently elevated groundwater is anticipated to be in excess 100 feet below the existing ground surface. Generally, subsurface water conditions vary in the region because of many factors such as, the proximity to bedrock, topographic elevations, and proximity to surface water. Some evidence of past repeated exposure to subsurface water may include black staining, clay deposits, and surface markings indicating previous seepage. Based on our experience in the area, perched water conditions are *highly anticipated* near the soil and bedrock contact at the site.

3.0 CONCLUSIONS

In our opinion, the site appears suitable, from a geotechnical standpoint, for the proposed

resdidential housing project. No conditions were observed that would constitute a sufficiently severe geotechnical constraint that constructing the proposed project would be precluded. The primary geotechnical concerns anticipated at this site are excavations into bedrock and drainage related to the anticipated shallow bedrock condition. The potential for excessive total and differential settlement, liquefaction, slope stability, soil expansion, asbestos, and excavation considerations are also discussed below. The degree to which the above constraints will affect the project should be assessed within a design-level investigation and report once the project reaches its appropriate stage.

Excavations into Bedrock

Based on our experience in the area, we expect that the site soils can be excavated using conventional earthmoving equipment such as a Caterpillar D6 to D8 for grading and rubber tired backhoe for trench excavations not extending to the underlying bedrock materials. The underlying bedrock materials can likely be excavated to depths of several feet using a Caterpillar D9, equipped with a single or multiple shank rippers, or similar equipment. However, blasting cannot be ruled out in areas of resistant rock. Pre-ripping during mass grading may be beneficial and should be considered with the Geotechnical Engineer prior to, or during mass grading.

Utility trenches will likely encounter hard rock excavation conditions especially in deeper cut areas. Utility contractors should be prepared to use special rock trenching equipment such as large excavators (Komatsu PC400 or CAT 345 or equivalent). Blasting to achieve utility line grades, especially in planned cut areas, cannot be precluded. Water inflow into any excavation approaching the hard rock surface is very likely to be experienced in all but the driest summer and fall months.

Drainage

Proper application of drainage practices is considered to be of paramount concern for the effective development of the project site and to provide long term stability of the structural improvements. It has been our experience that sites constructed within this area generally have an increased potential for moisture related issues related to water perched on the bedrock horizon and/or present in the fractures of the bedrock as well as moisture transmission through utility trenches. Potential sources of groundwater may not be present or observed during the site grading procedures, but can appear later as more persistent seepage as water becomes perched or flows through fractures of the bedrock. These conditions generally become more prevalent following up gradient development and the addition of moisture sources (i.e. landscape irrigation, run-off, etc.).

To reduce the potential of these issues, application of the drainage provisions provided in the 2019 CBC are imperative, as well as additional drainage improvements. Swales and natural hillside drainage at the site which is to receive engineered fill will likely require the installation of canyon style drains. Additionally, in developments with the potential for a perched groundwater condition, underground utilities can become collection points for subsurface water. Therefore, we will likely recommend that plug and drains be installed within the utility trenches to collect and convey water to the storm drain system or other approved outlet. Temporary dewatering measures may be necessary and could include the installation of submersible pumps and/or point wells. Lastly, proper surface drainage, and careful installation of subdrains and back of retaining wall drains will be necessary to provide long term stability of the structural improvements as well as mitigate nuisance seepage. Once plans are developed, the civil engineer should coordinate with us to discuss the locations of plug and drains.

Total and Differential Settlement

Total and differential settlement under static conditions can occur when foundations span materials having variable compression and/or low density characteristics. Based upon the subsurface conditions anticipated and our experience in the area, the upper soils at the site are expected to be in a soft to medium stiff condition. When subjected to additional loading, soft soils tend to settle more than soils in a stiff condition or bedrock, and are more susceptible to higher amounts of total and differential settlement, which can stress and possibly damage foundations, often resulting in cracks and displacement. To reduce the potential for excessive total and differential settlement under static conditions, a program of overexcavation and recompaction in the building and other improvement areas will likely be necessary. Typically, mass grading operations for foothill subdivisions generally mitigate these conditions; however, professional observation during grading operations will be necessary.

Liquefaction

Liquefaction is the sudden loss of soil shear strength and sudden increase in porewater pressure caused by shear strains, as could result from an earthquake. Research has shown that saturated, loose to medium-dense sands with a silt content less than about 25 percent and located within the top 40 feet are most susceptible to liquefaction and surface rupture/lateral spreading.

Due to the anticipated absence of permanently elevated groundwater table, the relatively low seismicity of the area and the relatively shallow depth to rock, the potential for seismically induced damage due to liquefaction, surface ruptures, and settlement is considered negligible. For the above-mentioned reasons mitigation for these potential hazards is not considered necessary for the development of this project.

Slope Stability

The existing slopes on the project site were observed to be shallow, have adequate vegetation on the slope face, appropriate drainage away from the slope face, and no apparent tension cracks or slump blocks in the slope face or at the head of the slope. No other indications of slope instability such as seeps or springs were observed. Additionally, due to the absence of permanently elevated groundwater table, the relatively low seismicity of the area, and the relatively shallow depth to rock, the potential for seismically induced slope instability for the existing slopes is considered negligible.

Expansive Soils

The materials at the site are anticipated to be generally non-plastic (rock, sand, and non-plastic silt), which are considered to be nonexpansive; however, occasional pockets of plastic materials (clay soils) may be encountered. Expansive soils tend to swell with seasonal increases in soil moisture and shrink during the dry season as soil moisture decreases. The volume changes that the soils undergo in this cyclical pattern can stress and damage slabs, foundations, and other improvements if precautionary measures are not incorporated into the design and construction procedure.

To reduce the potential for damage related to expansive soils, if present at the site, special design considerations may be necessary. These may include the mixing of expansive and nonexpansive soils during mass grading operations, focused clay excavations, and/or special foundation and slab preparation recommendations. Typically, mass grading operations for foothill subdivisions generally mitigate expansive soil conditions; however, professional observation during grading operations will be necessary.

Naturally Occurring Asbestos

Asbestos is classified by the EPA as a known human carcinogen. Naturally occurring asbestos (NOA) has been identified as a potential health hazard. El Dorado County published a map dated 24 August 2018 that qualitatively indicates the likelihood for NOA in western El Dorado County. The project site is not identified as being in a NOA review zone based on the published map. Therefore, NOA mitigation is not anticipated to be necessary for development of the site.

Summary

The site is considered feasible for the planned residential project. In our opinion, no significant geotechnical engineering constraints are apparent. It will be necessary to provide additional geotechnical work for this site (exploratory test pits, laboratory testing, analyses, etc.) in order to complete the final geotechnical engineering study. The geotechnical engineering study should provide specific preliminary geotechnical recommendations pertaining to the design and construction of the earthwork, structures, and improvements associated with this site.

4.0 ANTICIPATED DESIGN CRITERIA

The following anticipated design criteria are intended to be used by the architect/engineer for cost estimation purposes only. Additional field and laboratory work is needed to provide preliminary geotechnical recommendations for site preparation, grading, utility trenches, foundations, interior slabs-on-grade and pedestrian flatwork, retaining walls, pavement sections, and drainage.

Seismic Criteria

Based on the 2019 California Building Code, Chapter 16, and our experience in the area, the following seismic parameters may be utilized for preliminary structural design.

Table 1: Seismic Design Parameters

Reference		Seismic Parameter	Recommended Value
ASCE 7-16	Table 20.3-1	Site Class	C
	Figure 22-7	Maximum Considered Earthquake Geometric Mean (MCE_C) PGA	0.169g
	Table 11.8-1	Site Coefficient F_{PGA}	1.231
	Equation 11.8-1	PGAM = F_{PGA} PGA	0.208g
2019 CBC	Figure 22-1 **	Short-Period MCE at 0.2s, S_S	0.396g
	Figure 22-2 **	1.0s Period MCE, S_1	0.205g
	Table 1613.2.3(1)	Site Coefficient, F_a	1.300
	Table 1613.2.3(2)	Site Coefficient, F_v	1.500
	Equation 16 -36	Adjusted MCE Spectral Response Parameters, $S_{MS} = F_a S_s$	0.515g
	Equation 16 -37	Adjusted MCE Spectral Response Parameters, $S_{M1} = F_v S_1$	0.308g
	Equation 16-39	Design Spectral Acceleration Parameters, $S_{DS} = ⅔ S_{MS}$	0.344g
	Equation 16-40	Design Spectral Acceleration Parameters, $S_{D1} = ⅔ S_{M1}$	0.205g
	Table 1613.2.5(1)	Seismic Design Category (Short Period), Occupancy I to III	C
	Table 1613.2.5(1)	Seismic Design Category (Short Period), Occupancy IV	D
	Table 1613.2.5(2)	Seismic Design Category (1-Sec Period), Occupancy I to IV	D

*Based on the online calculator available at https://earthquake.usgs.gov/ws/designmaps/
** Section 1613.1 of the CBC indicates that either Section 1613 or ASCE 7-16 may be used for determination of seismic design categories.

Shallow Conventional Foundations

Shallow conventional foundation systems are anticipated to be suitable for construction of the planned structures. An allowable dead plus live load bearing pressure of 2,500 psf may be used for preliminary design purposed of conventional shallow foundations. An ultimate passive

equivalent fluid pressure of 300 pcf and a coefficient of friction of 0.35 are anticipated for the foundations. These are ultimate values that may require application of appropriate safety factors, load factors, depth factors, and/or other factors as deemed appropriate by the architect/engineer.

A total settlement of less than 1 inch is anticipated; a differential settlement of 0.5 inches in 25 feet is anticipated where foundations are bearing on like materials. The settlement criteria are based upon the assumption that foundation will be sized and loaded in accordance with the recommendations in this report.

Conventional shallow foundations may be planned to be a minimum of 12 inches wide and founded a minimum of 12 inches below the lowest adjacent soil grade for buildings up to two-stories in height. Isolated pad (spread) footings should be a minimum of 24 inches square and founded a minimum of 12 inches below the lowest adjacent soil grade.

Retaining Walls

Retaining walls may be designed to resist lateral pressure exerted from a soil media having an equivalent fluid weight provided in the table below. In accordance with Section 1803.5.12.1 of the 2109 California Building Code, application of the seismic design values for earthquake loading are required for retaining walls supporting more than 6 feet of backfill. The values presented below are for conditions when engineered fill is used within the zone behind the wall defined as twice the height of the retaining wall.

Table 2: Retaining Wall Pressures

Wall Type	Wall Slope Configuration	Equivalent Fluid Weight (pcf)	Lateral Pressure Coefficient	Earthquake Loading (plf)**	
Free Cantilever	Flat	35	0.28	$4H^2$	Applied 0.6H above the base of the wall
	2H:1V	50	0.41		
Restrained*	Flat	50	0.41	$12H^2$	

* Restrained conditions shall be defined as walls which are structurally connected to prevent flexible yielding, or rigid wall configurations (i.e. walls with numerous turning points) which prevent the yielding necessary to reduce the driving pressures from an at-rest state to an active state.

** Section 1803.5.12 of the 2019 California Building Code states that a determination of lateral pressures on basement and retaining walls due to earthquake loading shall be provided for structures to be designed in Seismic Design Categories D, E or F (Load value derived from Wood (1973) and modified by Whitman (1991)).

If keyed or interlocking non-mortared walls such as Keystone, Baselite, Allen Block, or rockery walls are utilized, the following soil parameters may be applicable for design within on-site, native materials:

Table 3: Modular Retaining Wall Design Parameters

Internal Angle of Friction	Cohesion	Bulk Unit Weight
32°	0 psf	125 psf

Asphalt Concrete Pavement Design

The pavement sections listed in the table below were based upon an assumed soil resistance value, or “R-Value,” of 35, and were calculated in accordance with the methods presented in the Sixth Edition of the California Department of Transportation Highway Design Manual.

Table 4: Asphalt Pavement Section Recommendations

Design Traffic Indices	Alternative Pavement Sections (Inches)	
	Asphalt Concrete *	Aggregate Base **
5.0	2.5 3.0	6.0 4.5
5.5	3.0 3.5	6.0 5.0
6.0	3.0 3.5	7.5 6.5
6.5	3.5 4.0	8.0 7.0
7.0	4.0 4.5	8.5 7.5
7.5	4.5 5.0	9.0 8.0
8.0	4.5 5.0	10.0 9.5
8.5	5.0 5.5	10.5 10.0
9.0	5.5 6.0	11.0 10.5

* Asphalt Concrete: must meet specifications for Caltrans Hot Mix Asphalt Concrete
** Aggregate Base: must meet specifications for Caltrans Class II Aggregate Base (R-Value = minimum 78)

Portland Cement Concrete Pavement Design

The pavement sections listed in the table below were based upon an assumed soil resistance value, or "R-Value," of 35, and were calculated in accordance with the methods presented in the American Concrete Institute (ACI) Concrete Pavement Design (ACI 330R-08).

Table 5: Concrete Pavement Section Recommendations

Category	ADTT*	Pavement Traffic Description	Thickness (inches)	
			3000 psi**	4000 psi**

** 28-day concrete compressive strength

5.0 CLOSURE

This report is valid for conditions as they exist at this time for planning the type of project described herein. Our intent was to assess the geotechnical feasibility in a manner consistent with the level of care and skill ordinarily exercised by members of the profession currently practicing in the locality of this project under similar conditions at this time. No representation, warranty, or guarantee is either expressed or implied. This report is intended for the exclusive use by the client, as discussed in the "Purpose and Scope" section of this report. Application beyond the

stated intent is strictly at the user's risk.

The preliminary opinions and conclusions of this feasibility report are based upon a site reconnaissance, review of available published and Youngdahl Consulting Group, Inc. own archival geotechnical data for the approximate project area, and our knowledge of the area. These opinions and conclusions should be confirmed and augmented by a geotechnical engineering study once the project reaches an appropriate stage.

Appendix E
Greenhouse Gas Emissions Regulatory Setting

Greenhouse Gas Regulatory Setting

State

The statewide GHG emissions regulatory framework is summarized in this subsection by category: state climate change targets, building energy, renewable energy and energy procurement, mobile sources, water, solid waste, and other state actions. The following text describes EOs, Assembly Bills (ABs), Senate Bills (SBs), and other plans and policies that would directly or indirectly reduce GHG emissions and/or address climate change issues.

State Climate Change Targets

California Air Resources Board's Regulations for the Mandatory Reporting of GHG Emissions

CARB's Regulation for the Mandatory Reporting of GHG Emissions (17 CCR 95100–95157) incorporated by reference certain requirements that EPA promulgated in its Final Rule on Mandatory Reporting of GHGs (40 CFR, Section 98). Specifically, Section 95100(c) of the Mandatory Reporting Regulation incorporated those requirements that EPA promulgated in the Federal Register on October 30, 2009; July 12, 2010; September 22, 2010; October 28, 2010; November 30, 2010; December 17, 2010; and April 25, 2011. In general, entities subject to the Mandatory Reporting Regulation that emit over 10,000 MT CO_2e per year are required to report annual GHG emissions through the California Electronic GHG Reporting Tool. Certain sectors, such as refineries and cement plants, are required to report regardless of emission levels. Entities that emit more than the 25,000 MT CO_2e per year threshold are required to have their GHG emissions report verified by a CARB-accredited third party.

Executive Order B-18-12

EO B-18-12 (April 2012) directed state agencies, departments, and other entities under the Governor's executive authority to take action to reduce entity-wide GHG emissions by at least 10% by 2015 and 20% by 2020, as measured against a 2010 baseline. EO B-18-12 also identified goals for existing state buildings for reducing grid-based energy purchases and water use.

Senate Bill 605 and Senate Bill 1383

SB 605 (2014) requires CARB to complete a comprehensive strategy to reduce emissions of SLCPs in the state (California Health and Safety Code Section 39730) and SB 1383 (2016) requires CARB to approve and implement that strategy by January 1, 2018 (California Public Resources Code Sections 42652–43654). SB 1383 also establishes specific targets for the reduction of SLCPs (40% below 2013 levels by 2030 for CH_4 and HFCs, and 50% below 2013 levels by 2030 for anthropogenic black carbon) and provides direction for reductions from dairy and livestock operations and landfills. Accordingly, and as mentioned above, CARB adopted its SLCP Reduction Strategy in March 2017 (CARB 2017). The SLCP Reduction Strategy establishes a framework for the statewide reduction of emissions of black carbon, methane, and fluorinated gases (CARB 2017).

Assembly Bill 1757

AB 1757 (September 2022) requires the CNRA to determine a range of targets for natural carbon sequestration, and for nature-based climate solutions that reduce GHG emissions for future years 2030,

2038, and 2045. These targets are to be determined by no later than January 1, 2024, and are established to support the state's goals to achieve carbon neutrality and foster climate adaptation and resilience.

Heavy-Duty Diesel

CARB adopted the final Heavy-Duty Truck and Bus Regulation on December 31, 2014, to reduce DPM, a major source of black carbon, and NO_x emissions from heavy-duty diesel vehicles (13 CCR, Part 2025). The rule requires that DPM filters be applied to newer heavier trucks and buses by January 1, 2012, with older vehicles required to comply by January 1, 2015. The rule will require nearly all diesel trucks and buses to be compliant with the 2010 model year engine requirement by January 1, 2023. CARB also adopted an Airborne Toxics Control Measure to limit idling of diesel-fueled commercial vehicles on December 12, 2013. This rule requires diesel-fueled vehicles with gross vehicle weights greater than 10,000 pounds to idle no more than 5 minutes at any location (13 CCR, Part 2485).

Water

Senate Bill X7-7, Executive Order B-29-15, and Executive Order N-10-21

SB X7-7, or the Water Conservation Act of 2009, required that all water suppliers increase their water use efficiency with an overall goal of reducing per capita urban water use by 20% by December 31, 2020. Each urban water supplier was required to develop water use targets to meet this goal.

In response to the ongoing drought in California, EO B-29-15 (April 2015) set a goal of achieving a statewide reduction in potable urban water usage of 25% relative to water use in 2013. The term of the EO extended through February 28, 2016, although many of the directives have become permanent water-efficiency standards and requirements. The EO includes specific directives that set strict limits on water usage in the state. In response to EO B-29-15, the California Department of Water Resources modified and adopted a revised version of the Model Water Efficient Landscape Ordinance that, among other changes, significantly increases the requirements for landscape water use efficiency and broadens its applicability to include new development projects with smaller landscape areas.

In response to a state of emergency due to severe drought conditions, EO N-10-21 (July 2021) called on all Californians to voluntarily reduce their water use by 15% from their 2020 levels. Actions suggested in EO N-10-21 include reducing landscape irrigation, running dishwashers and washing machines only when full, finding and fixing leaks, installing water-efficient showerheads, taking shorter showers, using a shut-off nozzle on hoses, and taking cars to commercial car washes that use recycled water.

Solid Waste

Assembly Bill 939, Assembly Bill 341, Assembly Bill 1826, and Senate Bill 1383

In 1989, AB 939, known as the Integrated Waste Management Act (California Public Resources Code Section 40000 et seq.), was passed because of the increase in waste stream and the decrease in landfill capacity. The statute established the California Integrated Waste Management Board (replaced in 2010 by the California Department of Resources Recycling and Recovery, or CalRecycle), which oversees a disposal reporting system. AB 939 mandated a reduction of waste being disposed where jurisdictions were required

to meet diversion goals of all solid waste through source reduction, recycling, and composting activities of 25% by 1995 and 50% by the year 2000.

AB 341 (2011) amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is the policy goal of the state that not less than 75% of solid waste generated be source-reduced, recycled, or composted by the year 2020, and annually thereafter. In addition, AB 341 required CalRecycle to develop strategies to achieve the state's policy goal. CalRecycle has conducted multiple workshops and published documents that identify priority strategies that it believes would assist the state in reaching the 75% goal by 2020.

AB 1826 (Chapter 727, Statutes of 2014, effective 2016) requires businesses to recycle their organic waste (i.e., food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste) depending on the amount of waste they generate per week. This law also requires local jurisdictions across the state to implement an organic waste recycling program to divert organic waste generated by businesses, including multifamily residential dwellings that consist of five or more units. The minimum threshold of organic waste generation by businesses decreases over time, which means an increasingly greater proportion of the commercial sector will be required to comply.

SB 1383 (2016) requires a 50% reduction in organic waste disposal from 2014 levels by 2020 and a 75% reduction by 2025—essentially requiring the diversion of up to 27 million tons of organic waste—to reduce GHG emissions. SB 1383 also requires that not less than 20% of edible food that is currently disposed be recovered for human consumption by 2025.

1.0 - INTRODUCTION

Creekside Village is a proposed 208-acre community in the south part of El Dorado Hills, El Dorado County, California. Creekside Village lies on the west side of Latrobe Road approximately two miles south of the Latrobe Road/White Rock Road intersection.

2.0 - EXISTING CONDITIONS

The project site is currently undeveloped land consisting of non-native grasslands with drainage flows from east to west. The project site is situated on relatively flat terrain considering that the surrounding region marks the first foothills of the Sierra Nevada on the east margin of the Sacramento Valley. The Carson Creek watershed encompasses approximately 15 square miles (9,600 acres), mostly located in the El Dorado Hills community of western El Dorado County, from the origins of Carson Creek north of US Highway 50 to the El Dorado/Sacramento County line. The project lies within the larger drainage shed CY5E of the Carson Creek watershed. Drainage shed CY5E encompasses 280 acres and the proposed project takes up 208 of those acres. There is an unnamed creek that flows through the project site from the east to the west. This creek ultimately reaches the Carson Creek.

3.0 - PROPOSED CONDITIONS

The proposed project will be a master planned neighborhood featuring a mix of home types, a community center, parks, trails and open space, which will allow connections to the Business Park and surrounding communities. Proposed conditions retain the existing drainage pattern through the project site. The proposed grading would increase the drainage area at Point D by 7.6 acres. The project will result in an approximate impervious area of 97.4 acres including roads.

4.0 - DESIGN RUNOFF

Design runoff was computed using HEC-HMS computer program. These computations also validate the effectiveness of on-site detention storage. Proposed facilities operate in concert so that the 2-year flows do not exceed pre-project levels as required by “Hydromodifications Project” of the *West Slope Development and Redevelopment Standards and Post Construction Storm Water Plan Requirements*. HEC-HMS computations simulate the rainfall-runoff process for a 24-hour storm assumed to occur uniformly over the study area. The computations utilize the SCS dimensionless unit hydrograph method to transform precipitation excess, defined as rainfall *not* lost to surface retention by vegetation, cracks and crevices, local depressions, etc., or infiltrated into the ground, into runoff. Precipitation losses are computed within the program on the basis of a runoff curve number (CN) assigned to each shed. CN values reflect land usage and the runoff potential of underlying soils. Input datum required for the development of a unit hydrograph for each sub basin is the estimated lag time, defined as the time between the center of mass of precipitation excess and the unit hydrograph peak, and simplified as 0.6X time of concentration. Input parameters used for each contributing shed in hydrograph computations are: a runoff curve number used in the computation of precipitation losses, and; a lag time, from which the SCS dimensionless unit hydrograph is constructed.

5.0 – HYDROMODIFICATION

As required by “Hydromodifications Project” of the *West Slope Development and Redevelopment Standards and Post Construction Storm Water Plan Requirements,* this project requires verification showing post project flows will not exceed pre-project flow rate for the 2-year, 24-hour storm. A preliminary study was conducted to confirm that this requirement is achievable. A portion of the project will be directed to the pond where it can be detained and released at pre development flows. See Appendix C for Hydromodification Shed Map. The shed map depicts the general areas that will be draining to the pond. Hydrograph calculations show a more detailed breakdown of the areas within the shed that are contributing to the pond. See Appendix C for hydrograph calculations.

Table 1 – Flow Summary

SHED/KEY POINT	***2-YEAR RUNOFF***	
	PRE-DEVEL	***POST-DEVEL***
D	68.85 cfs	68.84 cfs

6.0 –WATER QUALITY

Water quality considerations will be reviewed at the project improvement plan stage and appropriate analyses will be included in a subsequent drainage report. The El Dorado County Storm Water Management Plan (SWMP), dated August 2004, serves as a regulatory document related to reducing the discharge of pollutants associated with storm water drainage systems. There are 4 Post Construction Water Quality (PCSWQ) lots that will be used for water quality treatment.

The final water quality methods and details will be worked out at improvement plans stage.

The following Treatment Control BMPs also may be incorporated into final design of the project if a project proponent would like to reduce water quality flow (WQF) requirements:

1. Incorporation within the site's plan or design, land use planning measures to minimize water quality impacts, including stream buffers and restoration activities.

2. Reduction of the site's imperviousness, conserving natural resources and areas, maintaining and using natural drainage courses in the storm water conveyance system and minimizing clearing and grading.

3. When landscaping is required or proposed, provision of runoff storage measures dispersed uniformly throughout the site's landscape with the use of a variety of detention, retention, and runoff practices.

4. Implementation of on-site hydrologically functioning landscape design and management practices.

5. Minimize project's impervious footprint and conserve natural areas. Minimize directly connected impervious areas.

6. Where landscaping is proposed in or adjacent to parking areas, to the extent feasible, incorporate landscaped areas into a site drainage design that minimizes runoff.

7.0 –CONCLUSIONS

The 10 and 100 year flows for this site were evaluated with the *Carson Creek Regional Drainage Study 2005 Update* and that the study shows that additional storage (detention ponds) would provide no notable mitigation of peak flows. The Shed CY5E was analyzed with a CN value of 84 which equates to residential 1 acre lots but the project proposes a higher residential density. However, Key node 10, which is downstream of the project, shows a decrease of flow by 400cfs. Refer to the *Carson Creek Regional Drainage Study 2005 Update* for more information and data analysis in the Appendix E. The project is located on the lower end of the Carson Creek Regional shed. The objective with this property is to discharge the runoff from this development before the upstream drainage area reaches the property. The detention pond as proposed is designed to meet the hydromodification requirements that mitigate the 2-year, 24 hour storm alone. No detention is needed nor proposed to provide mitigation for the 10 and 100 year flows as noted hereinbefore.

Urban Hydrology for Small Watersheds, US Department of Agriculture, Natural Resources Conservation Service – Technical Release 55

Table 2-2a. – Runoff curve numbers for urban areas[1]

Cover description		Curve numbers for hydrologic soil group -			
Cover type and hydrologic condition	Average percent impervious area[2]	A	B	C	D
Fully developed urban areas (vegetation established)					
Open space (lawns, parks, golf courses, cemeteries, etc.)[3]:					
Poor condition (grass cover < 50%)……		68	79	86	89
Fair condition (grass cover 50% to 75%)……..		49	69	79	84
Good condition (grass cover > 75%)…….....		39	61	74	80
Impervious areas:					
Paved parking lots, roofs, driveways, etc. (excluding right-of-way)		98	98	98	98
Streets and roads:					
Paved; curbs and storm sewers (excluding right-of-way)…….		98	98	98	98
Paved; open ditches (including right-of-way)…….		83	89	92	93
Gravel (including right of way)……..		76	85	89	91
Dirt (including right-of-way)…….....		72	82	87	89
Western desert urban areas:					
Natural desert landscaping (pervious areas only)[4]……		63	77	85	88
Artificial desert landscaping (impervious weed barrier, desert shrub with 1- to 2-inch sand or gravel mulch and basin borders)……		96	96	96	96
Urban districts:					
Commercial and business……	85	89	92	94	95
Industrial……..	72	81	88	91	93
Residential districts by average lot size:					
1/8 acre or less (town houses)……..	65	77	85	90	92
1/4 acre……	38	61	75	83	87
1/3 acre……	30	57	72	81	86
1/2 acre……	25	54	70	80	85
1 acre……	20	51	68	79	84
2 acres……	12	46	65	77	82
Developing urban areas					
Newly graded areas (pervious areas only, no vegetation)[5]……..		77	86	91	94
Idle lands (CN's are determined using cover types similar to those in table 2-2c).					

[1]Average runoff condition, and $I_a = 0.2S$.
[2]The average percent impervious area shown was used to develop the composite CN's. Other assumptions are as follows: impervious areas are directly connected to the drainage system, impervious areas have a CN of 98, and pervious areas are considered equivalent to open space in good hydrologic condition. CN's for other combinations of conditions may be computed using figure 2-3 or 2-4.
[3]CN's shown are equivalent to those of pasture. Composite CN's may be computed for other combinations of open space cover type.
[4]Composite CN's for natural desert landscaping should be computed using figures 2-3 or 2-4 based on the impervious area percentage (CN = 98) and the pervious area CN. The pervious area CN's are assumed equivalent to desert shrub in poor hydrologic condition.
[5]Composite CN's to use for the design of temporary measures during grading and construction should be computed using figures 2-3 or 2-4, based on the degree of development (impervious area percentage) and the CN's for the newly graded pervious areas.

2005 UPDATE
CARSON CREEK REGIONAL DRAINAGE STUDY

INTRODUCTION

The January 1996 *Carson Creek Regional Drainage Study* provided a "unified plan for stormwater management within the portion of the watershed that lies in El Dorado County." The *CCRDS* study area encompasses approximately 15 square miles, mostly located in the El Dorado Hills community of western El Dorado County, from the origins of Carson Creek north of US Highway 50 to the El Dorado / Sacramento County line. The original study offered an assessment of projected impacts due to development within areas draining to Carson Creek and its tributaries, resulting from a 100-year, 24-hour storm event.

Under natural, undeveloped conditions within the Carson Creek watershed, there is little infiltration into area soils and a high proportion of rainfall results in direct runoff to the main channel and its tributaries. The upper reaches of the stream network are characterized by relatively steep, incised channels, with minimal overbank floodplain areas. However, the stream gradient flattens between US Highway 50 and the Sacramento County line, and as a result the lower reaches of Carson Creek and its tributaries may overflow during major rainfall events. The introduction of additional impervious area and alteration of existing soil cover resulting from new development can be expected to produce increased stormwater runoff, with possible effects on the frequency and magnitude of overflowing.

Since the time the *CCRDS* was adopted by DOT, significant improvements have been constructed within the watershed area south of US Highway 50. These projects include, but are not necessarily limited to: Town Center East, Town Center West, Creekside Greens, Valley View White Rock Village, and Carson Creek Phase 1. Additional growth is projected, as plans for Valley View West Valley Village and Carson Creek Phase 2 are implemented.

PURPOSE OF STUDY UPDATE

Hydrologic and hydraulic computations included in the *CCRDS* reflect the best information available at the time of study completion. The projects noted above were then in the initial design stages, and the level of detail used in representing the rainfall-runoff process for the affected shed areas was necessarily limited. Analyses included in the *CCRDS* indicate that flow in the lower reaches of Carson Creek can be particularly sensitive to the timing of runoff hydrographs from these project locales.

The purpose of the *CCRDS* update is to incorporate revised shed parameters for the lower portion of the Carson Creek watershed into the regional model. As in the *CCRDS*, a primary concern of the updated study is consideration of flow in

Carson Creek at the El Dorado / Sacramento County line, as well as at project-specific locations within the watershed.

The methods used in updating the *CCRDS* are consistent with guidelines and procedures of *County of El Dorado Drainage Manual*, adopted March 15, 1995.

OTHER STUDIES

The 2005 update to the *CCRDS* is based, in part, on information obtained from the following reports:

- *Carson Creek Regional Drainage Study Volumes 1 and 2,* January 1996, prepared for El Dorado County Department of Transportation by Shari Bottorff
- *Drainage Study for Euer Ranch (Carson Creek Phase 1),* January 13, 2003 (Revised), Cooper, Thorne & Associates, Inc.
- *Drainage Analysis for Town Center East Development,* September 2002, Wood-Rodgers, Inc.
- *Storm Drainage Improvements Associated With West Valley Village Phases 1 & 2 (Units 1-8) Rough Grading Plans,* November 30, 2004, Cooper, Thorne & Associates, Inc.
- *An Addendum to Storm Drainage Improvements Associated With West Valley Village Phases 1 & 2 (Units 1-8) Rough Grading Plans,* March 15, 2005, Cooper, Thorne & Associates, Inc.
- *Addendum No. 2 to Storm Drainage Improvements Associated With West Valley Village Phases 1 & 2 (Units 1-8) Rough Grading Plans,* August 2005, Cooper, Thorne & Associates, Inc.
- *Drainage Report for West Valley Major Roadways,* March 7, 2005, R.E.Y. Engineers, Inc.
- *Drainage Study for West Valley Village Phase 2 Units 1A & 1B,* February 2005, Cooper, Thorne & Associates, Inc.
- *Drainage Report for West Valley Unit 2,* March 28, 2005, R.E.Y. Engineers, Inc.
- *Drainage Improvements Associated With West Valley Village – Unit 3,* June 22, 2005, Carlton Engineering, Inc.
- *Drainage Report for West Valley Unit 4,* March 7, 2005, R.E.Y. Engineers, Inc.
- *Drainage Improvements Associated With West Valley Village – Unit 5A,* February 10, 2005, Carlton Engineering, Inc.
- *Drainage Study for West Valley Village Phase 2 Unit 5B,* September 2005 (Revised), Cooper, Thorne & Associates, Inc.
- *Drainage Study for West Valley Village Phase 2 Units 6A – 6C,* September 2005 (Revised), Cooper, Thorne & Associates, Inc.
- *Drainage Report for West Valley Unit 7A,* March 7, 2005, R.E.Y. Engineers, Inc.

- *Drainage Report for West Valley Unit 7B,* March 14, 2005, R.E.Y. Engineers, Inc.
- *Drainage Improvements Associated With West Valley Village – Unit 8,* February 10, 2005, Carlton Engineering, Inc.
- *Drainage Study for West Valley Village Phase 2 Unit 18,* August 2005 (Revised), Cooper, Thorne & Associates, Inc.
- *Preliminary Drainage Study for West Valley Village Lots 6 & 7,* September 2005, Cooper, Thorne & Associates, Inc.
- *Comprehensive Drainage Report for West Valley Village,* November 2005, Cooper, Thorne & Associates, Inc.
- *El Dorado Hills Business Park Master Drainage Plan,* January 1991, Gene E. Thorne & Associates, Inc.

HYDROLOGIC ANALYSES

The rainfall-runoff process for anticipated build out of the Carson Creek watershed was replicated by means of the HEC-1 computer model, developed by the US Army Corps of Engineers Hydrologic Engineering Center. In the HEC-1 simulation, the stream basin is represented by a series of interconnected hydrologic and hydraulic components, i.e. sub basin sheds, channel routing reaches, detention sites. The model depicts the surface runoff response of the watershed to a precipitation event of specified intensity and duration, by means of streamflow hydrographs computed for specified locations throughout the network.

Shed Areas

Segmentation of the Carson Creek watershed into smaller shed areas determines the number and types of network components used in the computational process. In general, shed boundaries are based on natural topography, but may be modified to represent piped storm drain systems, or to reflect flows at key locations such as hydraulic structures or geo-political limits. It is assumed that model parameters within each shed reflect average conditions, and that precipitation and infiltration are uniform over the shed. This assumption is less accurate as shed sizes increase.

Much of the shed area north of US Highway 50 is unchanged since completion of the original *CCRDS;* input data for those sheds were adopted directly from *CCRDS* computer file FUTHEC1.DAT for use herein.

The present study focuses on the area south of Highway 50, where major growth is underway. Sheds within this portion of the Carson Creek watershed have been redefined to more realistically characterize existing and proposed improvements. Modifications to the HEC-1 input model, reflective of recent

development plans, were obtained from drainage studies completed subsequent to adoption of the *CCRDS,* notably *Drainage Study for Euer Ranch (Carson Creek Phase 1),* January 13, 2003 (Revised), Cooper, Thorne & Associates, Inc. and *Drainage Analysis for Town Center East Development,* September 2002, Wood-Rodgers, Inc.

Improvement plans for the West Valley Village segment of Valley View are currently in progress. Shed boundaries within this portion of the watershed were obtained from drainage plans for individual Units within West Valley, as cited in a preceding section of this report.

Flow in Tributary '4' originates from the ridgeline just east of West Valley Village, and is collected and conveyed through the project to several points of discharge along Latrobe Road. Project runoff thence crosses Latrobe Road via several culverts, identified as key points in the hydrologic computations, and enters the El Dorado Hills Business Park storm system.

Drainage facilities serving the Business Park consist primarily of open drainage swales and cross culverts, with minimal amounts of piped storm sewers. The Business Park shed area used in the *CCRDS* has been subdivided for the current analysis to reflect additional key locations at culverts crossings or outfall points. Shed parameters within the Business Park are consistent with the *El Dorado Hills Business Park Master Drainage Plan,* January 1991, Gene E. Thorne & Associates, Inc., as field-verified in September 2005.

Exhibit A presents redefined shed boundaries, consistent with existing and proposed improvement plans, used in the updated hydrograph computations.

Precipitation

Precipitation data applied to the study area were obtained from the *Drainage Manual.* Mean annual precipitation over the Carson Creek watershed averages approximately 26 inches; the corresponding 24-hour precipitation depth for a storm of 100-year return frequency is 5.26 inches. The average elevation within the study area is below 1640', resulting in temporal distribution of the 24-hour precipitation total characterized by the SCS Type 1 pattern. It is assumed that the specified precipitation is evenly distributed over the watershed.

Precipitation Losses

Interception and depression storage occurs as the result of surface retention of precipitation water by vegetation, local depressions, in cracks and crevices in impervious cover, or in areas where water is not free to move as overland flow. Infiltration is the movement of water to areas beneath the land surface. In the HEC-1 computations, such precipitation losses represent rainfall that does not contribute to the runoff process, and is therefore lost to the system.

Precipitation losses in the Carson Creek watershed are computed within HEC-1 by the SCS Curve Number method. A runoff curve number (CN) is assigned to each shed on the basis of ultimate land usage and the runoff potential of underlying soils. Soils within the study area are predominantly of the Auburn series, in shallow layers over nearly impermeable bedrock, characterized by high runoff potential. These soils are categorized in hydrologic soil group 'D'.

CN's assigned to shed areas redefined for the present study are summarized in Table A-1, located in Appendix A. The CN's, consistent with rational formula 'C' values used in pertinent drainage studies, are based on the following land use descriptions, or combinations thereof, found in the *Drainage Manual*.

Residential w/ 2 acre lot size – CN = 82
Residential w/ 1 acre lot size – CN = 84
Residential w/ 0.5 acre lot size – CN = 85
Residential w/ 0.25 acre lot size – CN = 87
Open space – CN = 80
Grassland – CN = 77
Impervious surfaces – CN = 98

Lag Times

HEC1 runoff computations transform precipitation excess into runoff by means of the unit hydrograph technique. For this study, the SCS dimensionless unit hydrograph method was used. The input datum for each shed consists of a single parameter, lag time, which is equal to the lag in hours between the center of mass of rainfall excess and the peak of the unit hydrograph. Lag time is expressed in simplified terms as 0.6 x Time of Concentration (Tc).

Lag times assigned to shed areas redefined for the present study are summarized in Table A-1, located in Appendix A. These values were derived from rational formula times of concentration reported in applicable drainage studies, where available, or computed in accordance with Section 2.4.2 of the *Drainage Manual*.

DETENTION STORAGE

Detention storage temporarily impounds runoff, with resultant delay in timing and reduction of the peak value of the outflow hydrograph. The same volume of water that enters detention is released, but outflow occurs over a longer period of time and at a lesser rate than inflow.

Existing detention facilities in Serrano, Rancho Dorado, Springfield Meadows, and Town Center East are represented in the updated HEC-1 runoff model,

based on stage-storage-discharge relationships developed by others and detailed in previous drainage studies.

The West Valley project contains in-channel wetlands mitigation ponds at two locations, as shown on Exhibit A. These ponds, currently in place, also provide limited volumes of detention storage during the design storm event. Pond outflow ratings for these facilities, based on field survey data, are incorporated into the updated HEC-1 model.

Additional peak flow attenuation may occur in certain reaches of the Carson Creek channel, where outflow is limited due to backwater effects at bridge or culvert constrictions. Temporary flood plain storage in the channel upstream of Golden Foothills Parkway, as simulated in the *CCRDS*, is included in the present analysis.

The tentative map for Carson Creek Phase 2 establishes wetland preserve and open space boundaries adjacent to the Carson Creek channel within the project. Potential channel storage reflecting proposed development up to these limits was evaluated by means of the US Army Corps of Engineers Hydrologic Engineering Center *Training Document No. 30* (TD 30), "River Routing With HEC1 and HEC2", for reaches between the Southern Pacific Railroad crossing and Carson Crossing Drive, and between Carson Crossing Drive and Golden Foothill Parkway. Storage-outflow relationships developed for the two reaches using TD30, as detailed in Appendix B, are included in the updated HEC-1 analysis.

Incidental detention storage that may occur due to debris blockage or backwater effects at minor crossings was not considered in the present study.

HEC-1 RESULTS

Table 1 shows a comparison of 100-year runoff computed in the updated hydrograph model at key points shown on Exhibit A, as compared to outcomes of the original *CCRDS* simulation of future conditions. Table 2 presents flows at additional key points. The HEC-1 summary output file is included in Appendix C.

TABLE 1 - CARSON CREEK REGIONAL DRAINAGE STUDY 2005 UPDATE FLOW COMPARISONS AT KEY POINTS

KEY POINT	LOCATION / DESCRIPTION	100-YEAR RUNOFF	
		CCRDS	2005 UPDATE
1	Carson Creek @ Latrobe Road	4600 cfs	4900 cfs
1a	Carson Creek west of Latrobe Road, @ confluence w/ 'CR' Tributary	5100 cfs	5500 cfs
2	Unnamed tributary @ Latrobe Road, below Wetlands Mitigation Pond 3	500 cfs	300 cfs
3	Carson Creek @ Golden Foothill Parkway	5600 cfs	5900 cfs
4	Carson Creek @ confluence w/ Tributary '3', below Carson Crossing Drive	6500 cfs	6900 cfs
5	Tributary '4' @ Latrobe Road, below Wetlands Mitigation Ponds 1 & 2	700 cfs	600 cfs
6	Tributary '4' @ confluence w/ Tributary '5'	1000 cfs	900 cfs
7	Tributary '5' @ Latrobe Road	70 cfs	90 cfs
8	Tributary '5' @ confluence w/ Tributary '4'	400 cfs	500 cfs
9	Combined flow in Tributaries '4' and '5'	1400 cfs	1400 cfs
10	Carson Creek @ study limit	7500 cfs	7100 cfs

Flow comparisons shown in Table 1 indicate apparent flow increases of less than 10% at Key Points 1, 1a, 3, and 4 in Carson Creek, and a 10% flow decrease at Point 10. Hydrologic studies of the nature undertaken for the updated Carson Creek analysis are necessarily based on certain empirical data and other generalized assumptions. The accepted level of accuracy of such analyses is generally +/- 10%. Since the divergence of computed flow values is within this range, it is considered negligible.

Flows crossing Latrobe Road at Key Points 2 and 5 show significant decreases as compared to *CCRDS* values. However, existing wetlands mitigation ponds in West Valley Village, upstream from these key points, provide limited detention volumes for attenuation of 100-year peak runoff. The apparent flow reductions at these crossings is due to redefinition of shed boundaries in the updated study, rather than to significant peak flow reduction due to detention routing.

The updated hydrograph model was re-run to simulate additional storage volume at either of the two West Valley Village wetlands mitigation pond locations. Based on the configurations of the ponds, adjacent site grading, and the proximity of the ponds to proposed Con/Span crossings on Blackstone Parkway, it was estimated that the maximum attainable volume increase at either site is about 20%. HEC-1 analyses of this scenario produced flow reductions of less than 3% at Key Point 1, 1a, 3, or 4 in Carson Creek. Since the additional storage would have insignificant impacts on peak flows in Carson Creek, further consideration is not recommended.

TABLE 2 - CARSON CREEK REGIONAL DRAINAGE STUDY 2005 UPDATE
100-YEAR FLOW AT KEY POINTS

KEY POINT	LOCATION / DESCRIPTION	100-YEAR Q
A	Latrobe Road north of West Valley Unit 18	95 cfs
B	Latrobe Road south of West Valley entry	17 cfs
C	Latrobe Road below Shed XQ	31 cfs
D	Latrobe Road south of Investment Boulevard, below Shed XP	14 cfs
E	Latrobe Road below Shed XN	26 cfs
F	Latrobe Road below Shed XM	53 cfs
G	Tributary '4' @ Robert J Mathews Parkway	610 cfs
H	Robert J Mathews Parkway north of Investment Boulevard	60 cfs
J	Tributary '4' @ Business Park boundary	770 cfs
K	South Fork of Tributary '4' @ Business Park boundary	90 cfs
L	Tributary '5' @ Business Park boundary	440 cfs
XL'	Latrobe Road below Shed XL'	5 cfs
Z'	Latrobe Road below Shed Z' (part of Shed Z)	<1 cfs

LATROBE ROAD CROSSINGS

The County of El Dorado Department of Transportation is currently processing project plans for the construction of Latrobe Road improvements. The realignment and widening projects include bridge construction at the Carson Creek crossing location, and extensions of existing culverts at other key locations identified in Tables 1 and 2. (Refer to Department of Transportation, El Dorado County California, *Project Plans for Construction of Improvements in El Dorado County for Latrobe Road and White Rock Road Realignment, Widening, and Bridge Project Phase II,* prepared by Dokken Engineering.)

Culvert capacities based on proposed Latrobe Road improvements at key locations were estimated from hydraulic design charts. Culverts were assumed to operate under inlet control utilizing all available head under the 100-year runoff scenario, with flow values as summarized in Tables 1 and 2. The findings are summarized in Table 3. The Carson Creek crossing at Key Point 1 was identified as undersized in the original *CCRDS;* bridge hydraulics for the replacement structure are not addressed herein.

TABLE 3 – CARSON CREEK REGIONAL DRAINAGE STUDY 2005 UPDATE
LATROBE ROAD CULVERT CAPACITIES

KEY POINT	100-YR Q (CFS)	CULVERT CAPACITY *		COMMENTS
		HW/D	Q	
A	95	3.5	90	Road overtops

BUSINESS PARK STORM DRAIN SYSTEM

The El Dorado Hills Business Park receives drainage from the ridge to the east of Latrobe Road, as well as from watershed area north of Highway 50. The study update focuses on runoff into tributary channels originating from the ridgeline within Valley View, which enter the Business Park drainage system via Latrobe Road culvert crossings identified in Tables 1 and 2. Storm drainage is conveyed through the Business Park in open drainage ways and cross culverts, with limited piped storm sewers.

It is recognized that sizing of existing storm drainage within the Business Park adheres to design standards pre-dating adoption of the *Drainage Manual*. The *CCRDS* update defines the level of service provided by existing facilities, when evaluated under current criteria. The *El Dorado Hills Business Park Master Drainage Plan,* prepared by Gene E. Thorne & Associates, Inc., July, 1991, was used as a basis for the evaluations, supplemented by review of a sampling of storm drain as-built plans and limited field observations. More detailed assessment is beyond the scope of the present study.

It was concluded that existing storm drainage facilities located within the Business Park south of Golden Foothills Parkway are, in general, capable of conveying 50-75% of 100-year runoff computed herein. The extent of possible flooding resulting from system deficiencies during the 100-year design storm is not addressed. However, the duration of such occurrences can be estimated by inspection of the runoff hydrographs generated in the HEC-1 computation process for selected locations within the Business Park system. These

hydrographs, representing the time distribution of runoff at selected locations in the Business Park, are included in the detailed HEC-1 output file included in Appendix C, and excerpted in Appendix D. Assuming storm drain system capacity of 50% to 75% of peak runoff, graphical interpretation of the runoff hydrographs indicates that system capacity is exceeded for a *maximum* of one hour during the 100-year, 24-hour design storm event. Because potential system overloading is of limited duration, it is felt that upgrades within the Business Park storm system are not warranted at this time.

BACKWATER COMPUTATIONS

The *CCRDS* included 100-year flood profiles for Carson Creek and its tributaries south of US Highway 50. Subsequent project-specific drainage studies have included updated flood plain delineations for selected stream segments impacted by those developments.

The present update includes re-analysis of the 100-year flood profile for the stream reaches specified below, based on revised HEC-1 results reported herein, and reflective of proposed development of the Carson Creek Phase 2 project.

- Carson Creek, from the Southern Pacific Railroad crossing to Golden Foothill Parkway.
- Tributary '3', from the confluence with Carson Creek to the Carson Creek Phase 1 / Phase 2 project boundary.
- Tributary '4', from the confluence with Carson Creek to the Carson Creek Phase 2 project limit, adjacent to the El Dorado Hills Business Park.
- Tributary '5', from the confluence with Tributary '4' to the Carson Creek Phase 2 project limit, adjacent to the El Dorado Hills Business Park.

The HEC-RAS computer program, developed by the US Army Corps of Engineers Hydrologic Engineering Center, was used to produce revised profiles resulting from 100-year runoff computed as part of the present study update. The backwater analyses were begun downstream of the railroad crossing, utilizing cross section data from the *CCRDS*. Cross sections within the Carson Creek Phase 2 project were digitized from 1-foot contour interval topography generated from April 2004 aerial photography. The cross sections represent proposed development limits coincident with field-identified wetlands boundaries.

Backwater computations are based on sub-critical flow analysis. Manning's "n" values reflect unmaintained channel and overbank areas. It is also assumed that channel flow is unrestricted by debris accumulation or other blockages within the streambeds or at culvert locations. The 100-year flow peak was assumed to be concurrent in the main Carson Creek channel as well as in its tributaries. Thus the downstream boundary condition for tributary profiles is the computed 100-year water surface elevation at the confluence with Carson Creek.

Computed 100-year base flood elevations and limits of inundation for the selected study reaches are shown on Exhiit B. HEC-RAS output data are detailed in Appendix E.

SUMMARY AND RECOMMENDATIONS

- The 2005 update to the *CCRDS* reflects the most current development scenario within the lower portion of the watershed, south of US Highway 50. Flows at key points common to the hydrograph analyses in both the original and the updated study are compared in Table 1. Computed 100-year flows at key points in Carson Creek are substantially unchanged from the original study.

- Existing culvert crossings along Latrobe Road are inadequately sized to pass computed 100-year flows. See Tables 1, 2, and 3. It is recommended that improvement plans for the realignment of Latrobe Road include analyses of culvert capacities based on flows reported herein, and that the plans be revised, as necessary, to assure the passage of 100-year runoff with a minimum of two feet of freeboard.

- It is estimated that storm drainage facilities within the El Dorado Hills Business Park are able to handle flows equivalent to at least 50% of 100-year design runoff computed herein. At this level of service, localized flooding along open channel drainage ways or at inlets to the piped system may occur for a maximum duration of 60 minutes during the 100-year, 24-hour design storm. Improvements to the existing system are not recommended based on the level of risk involved.

- The HEC-RAS computer program was used to generate new water surface profiles for stream channels within the future Carson Creek Phase 2 project. Revised flood plain delineations, shown in Exhibit B, reflect development limits established through field-identification of wetlands boundaries.

THIS PROGRAM REPLACES ALL PREVIOUS VERSIONS OF HEC-1 KNOWN AS HEC1 (JAN 73), HEC1GS, HEC1DB, AND HEC1KW.

THE DEFINITIONS OF VARIABLES -RTIMP- AND -RTIOR- HAVE CHANGED FROM THOSE USED WITH THE 1973-STYLE INPUT STRUCTURE.

THE DEFINITION OF -AMSKK- ON RM-CARD WAS CHANGED WITH REVISIONS DATED 28 SEP 81. THIS IS THE FORTRAN77 VERSION

NEW OPTIONS: DAMBREAK OUTFLOW SUBMERGENCE , SINGLE EVENT DAMAGE CALCULATION, DSS:WRITE STAGE FREQUENCY,
DSS:READ TIME SERIES AT DESIRED CALCULATION INTERVAL LOSS RATE:GREEN AND AMPT INFILTRATION
KINEMATIC WAVE: NEW FINITE DIFFERENCE ALGORITHM

Introduction

The proposed Creekside Village Residential Development (project) is a 208-acre residential development located south of El Dorado Hills Business Park, and west of Latrobe Road in El Dorado County, California. The project site is bordered to the north by the El Dorado Hills Business Park, the Blackstone master planned community (Valley View Specific Plan) to the east, undeveloped R & D land within the Carson Creek Specific Plan to the west, and undeveloped rural residential and industrial lands to the south. The proposed project consists of approximately 918 dwelling units, one village and two neighborhood parks, a 1.8-acre neighborhood commercial site, and approximately 46-acres of open space. The project area and site plan are shown in Figures 1 and 2, respectively.

The purposes of this assessment are to quantify the existing noise and vibration environments, identify potential noise and vibration impacts resulting from the project, identify appropriate mitigation measures, and provide a quantitative and qualitative analysis of impacts associated with the project. Specifically, impacts are identified if project-related activities would cause a substantial increase in ambient noise or vibration levels at existing sensitive land uses in the project vicinity, or if future traffic, commercial / business, or project-generated noise or vibration levels would exceed applicable federal, state, or local standards at the residences proposed within this development.

Noise and Vibration Fundamentals

Noise

Noise is often described as unwanted sound. Sound is defined as any pressure variation in air that the human ear can detect. If the pressure variations occur frequently enough (at least 20 times per second), they can be heard and are designated as sound. The number of pressure variations per second is called the frequency of sound and is expressed as cycles per second, or Hertz (Hz). Definitions of acoustical terminology are provided in Appendix A.

Measuring sound directly in terms of pressure would require a very large and awkward range of numbers. To avoid this, the decibel scale was devised. The decibel scale uses the hearing threshold (20 micropascals of pressure) as a point of reference, defined as 0 dB. Other sound pressures are then compared to the reference pressure, and the logarithm is taken to keep the numbers in a practical range. The decibel scale allows a million-fold increase in pressure to be expressed as 120 dB. Another useful aspect of the decibel scale is that changes in decibel levels correspond closely to human perception of relative loudness. Noise levels associated with common noise sources are provided in Figure 3.

The perceived loudness of sounds is dependent upon many factors, including sound pressure level and frequency content. However, within the usual range of environmental noise levels, perception of loudness is relatively predictable and can be approximated by filtering the frequency response of a sound level meter by means of the standardized A-weighting network. There is a strong correlation between A-weighted sound levels (expressed as dBA) and community response to noise. For this reason, the A-weighted sound level has become the standard tool of

environmental noise assessment. All noise levels reported in this section are in terms of A-weighted levels.

Community noise is commonly described in terms of the ambient noise level, which is defined as the all-encompassing noise level associated with a given noise environment. A common statistical tool to measure the ambient noise level is the average, or equivalent, sound level (L_{eq}). The L_{eq} is the foundation of the day-night average noise descriptor, DNL (or L_{dn}), and shows very good correlation with community response to noise. DNL is based on the average noise level over a 24-hour day, with a +10-decibel weighting applied to noise occurring during nighttime (10:00 PM to 7:00 AM) hours. The nighttime penalty is based on the assumption that people react to nighttime noise exposures as though they were twice as loud as daytime exposures. Because DNL represents a 24-hour average, it tends to disguise short-term variations in the noise environment.

Vibration

Vibration is like noise in that it involves a source, a transmission path, and a receiver. While vibration is related to noise, it differs in that noise is generally considered to be pressure waves transmitted through air, while vibration is usually associated with transmission through the ground or structures. As with noise, vibration consists of an amplitude and frequency. A person's response to vibration will depend on their individual sensitivity as well as the amplitude and frequency of the source.

Vibration can be described in terms of acceleration, velocity, or displacement. A common practice is to monitor vibration in terms of velocity in inches per second peak particle velocity (IPS, PPV) or root-mean-square (VdB, RMS). Standards pertaining to perception as well as damage to structures have been developed for vibration in terms of peak particle velocity as well as RMS velocities.

As vibrations travel outward from the source, they excite the particles of rock and soil through which they pass and cause them to oscillate. Differences in subsurface geologic conditions and distance from the source of vibration will result in different vibration levels characterized by different frequencies and intensities. In all cases, vibration amplitudes will decrease with increasing distance.

Human response to vibration is difficult to quantify. Vibration can be felt or heard well below the levels that produce any damage to structures. The duration of the event has an effect on human response, as does frequency. Generally, as the duration and vibration frequency increase, the potential for adverse human response increases.

According to the Transportation and Construction-Induced Vibration Guidance Manual (Caltrans, April 2020), operation of construction equipment and construction techniques generate ground vibration. Traffic traveling on roadways can also be a source of such vibration. At high enough amplitudes, ground vibration has the potential to damage structures and/or cause cosmetic damage. Ground vibration can also be a source of annoyance to individuals who live or work close to vibration-generating activities. However, traffic, rarely generates vibration amplitudes high enough to cause structural or cosmetic damage.

Environmental Setting – Existing Ambient Noise and Vibration Environment

Land Uses in the Project Vicinity

Noise-sensitive land uses are generally defined as locations where people reside or where the presence of unwanted sound could adversely affect the primary intended use of the land. Places where people live, sleep, recreate, worship, and study are generally considered to be sensitive to noise because intrusive noise can be disruptive to these activities. Existing noise-sensitive land uses within the project vicinity consist of residential uses to the east of the project across Latrobe Road, and a school use located northwest of the project area (John Adams Academy). Existing commercial / office uses are located to the north of the project site (El Dorado Hills Business Park), which are typically not considered to be noise-sensitive. The project area and surrounding land uses are shown in Figure 1.

Existing Traffic Noise Levels along Project Area Roadway Network

To predict traffic noise levels along existing roadway networks with multiple segments, modelling is commonly used rather than monitoring. The FHWA Traffic Noise Model (FHWA-RD-77-108) was used to quantify existing traffic noise levels at the existing sensitive land uses nearest to the project area roadway network. The Model was also used to quantify the distances to the 60, 65 and 70 dB DNL traffic noise contours for these roadways. The FHWA Model predicts hourly average (L_{eq}) values for free-flowing traffic conditions. Estimates of the hourly distribution of traffic for a typical 24-hour period were used to develop DNL values from L_{eq} values.

Existing (2023) traffic data in the form of AM and PM peak hour intersection turning movements were obtained from the traffic impact analysis prepared by the project transportation consultant (T. Kear Transportation Planning & Management). Those data were converted to Average Daily Traffic (ADT) segment volumes by applying a factor of 5 to the sum of AM and PM peak hour conditions. Other inputs were obtained from BAC observations and noise measurement data. The existing traffic noise levels at the distances representing the nearest noise-sensitive land uses to the project area roadways and distances from the centerlines of selected roadways to the 60 dB, 65 dB and 70 dB DNL contours are summarized in Table 1. Appendix B-1 contains the FHWA Model inputs for existing conditions.

Existing Overall Ambient Noise Environment within the Project Vicinity

The existing ambient noise environment at the project site is defined primarily by noise from traffic on Latrobe Road, and to a lesser extent by activities within the El Dorado Business Park to the north. To generally quantify existing ambient noise environment within the project area, BAC conducted long-term (72-hour) ambient noise level measurements at four (4) locations from

October 3-5, 2020. The long-term noise survey locations are shown in Figure 1. Photographs of the noise survey locations are provided in Appendix C.

Larson Davis Laboratories (LDL) Model 820 precision integrating sound level meters were used to complete the noise level measurements. The meters were calibrated immediately before and after use with an LDL Model CA200 acoustical calibrator to ensure the accuracy of the measurements. The equipment used meets all specifications of the American National Standards Institute requirements for Type 1 sound level meters (ANSI S1.4).

The results of the long-term ambient noise survey are shown numerically and graphically in Appendices D and E (respectively) and are summarized in Table 2.

Table 2
Long-Term Noise Level Measurement Results – October 3-5, 2020[1]

			Average Measured Hourly Noise Levels, dBA			
			Daytime[3]		Nighttime[4]	
Site Description[2]	Date	DNL	L_{eq}	L_{max}	L_{eq}	L_{max}
Site 1: Western project area boundary, approximately 800' from existing commercial / offices uses to north	10/3/20	52	45	59	46	54
	10/4/20	57	41	56	51	56
	10/5/20	50	44	60	43	50
Site 2: Northwest project area boundary, approximately 800' from existing commercial / office uses to north	10/3/20	53	50	68	46	63
	10/4/20	57	55	69	48	62
	10/5/20	54	54	69	45	61
Site 3: Northern project area boundary, approximately 50' from centerline of Latrobe Road	10/3/20	63	63	83	55	74
	10/4/20	61	60	80	52	74
	10/5/20	65	62	82	57	77
Site 4: Southeast project area boundary, approximately 200' from centerline of Latrobe Road	10/3/20	56	53	70	49	64
	10/4/20	54	51	68	47	65
	10/5/20	58	53	70	51	67

[1] Detailed summaries of the noise monitoring results are provided in Appendices D and E.
[2] Long-term ambient noise monitoring locations are identified in Figure 1.
[3] Daytime hours: 7:00 AM to 10:00 PM
[4] Nighttime hours: 10:00 PM to 7:00 AM

Source: BAC 2020.

As shown in Table 2, average measured hourly noise levels were generally consistent at each individual site throughout the monitoring period. The Table 2 data also indicate that measured day-night average noise levels were highest at site 3, which was likely due to the proximity of the measurement location to Latrobe Road. The slightly elevated measured nighttime noise levels at Sites 1 and 2 are believed to have been caused by natural sounds (crickets, frogs, etc.).

Existing Ambient Vibration Environment

During a site visit on October 2, 2020, vibration levels were below the threshold of perception at the project site. Nonetheless, to quantify existing vibration levels at the project site, BAC

conducted short-term (15-minute) vibration measurements at the four (4) locations identified in Figure 1. Photographs of the vibration survey locations are provided in Appendix C.

A Larson-Davis Laboratories Model LxT precision integrating sound level meter equipped with a vibration transducer was used to complete the measurements. The results are summarized below in Table 3.

Table 3
Summary of Ambient Vibration Monitoring Results – October 2, 2020

Site Description	Time	Average Measured Vibration Level, PPV (in. sec)[1]
Site 1: Western project area boundary	12:06 p.m.	<0.001
Site 2: Northwest project area boundary	12:59 p.m.	<0.001
Site 3: Northern project area boundary	1:59 p.m.	<0.001
Site 4: Southeast project area boundary	2:29 p.m.	<0.001
[1] PPV = Peak Particle Velocity (inches/second)		

Source: BAC 2020.

The Table 3 data indicate that measured average vibration levels at the project area boundaries were less than 0.001 in/sec PPV.

Regulatory Setting: Criteria for Acceptable Noise and Vibration Exposure

Federal

There are no federal noise or vibration criteria which would be directly applicable to this project.

State of California

California Environmental Quality Act (CEQA)

The State of California has established regulatory criteria that are applicable to this assessment. Specifically, Appendix G of the State of California Environmental Quality Act (CEQA) Guidelines are used to assess the potential significance of impacts pursuant to local General Plan policies, Municipal Code standards, or the applicable standards of other agencies. According to Appendix G of the CEQA guidelines, the project would result in a significant noise or vibration impact if the following occur:

A. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or other applicable standards of other agencies.

B. Generation of excessive groundborne vibration or groundborne noise levels.

C. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels.

It should be noted that audibility is not a test of significance according to CEQA. If this were the case, any project which added any audible amount of noise to the environment would be considered significant according to CEQA. Because every physical process creates noise, the use of audibility alone as significance criteria would be unworkable. CEQA requires a substantial increase in noise levels before noise impacts are identified, not simply an audible change.

California Department of Transportation (Caltrans)

El Dorado County does not currently have adopted standards for groundborne vibration. As a result, the vibration impact criteria developed by the California Department of Transportation (Caltrans) was applied to the project. The Caltrans criteria applicable to damage and annoyance from transient and continuous vibration typically associated with construction activities are presented in Tables 4 and 5. Equipment or activities typical of continuous vibration include: excavation equipment, static compaction equipment, tracked vehicles, traffic on a highway, vibratory pile drivers, pile-extraction equipment, and vibratory compaction equipment. Equipment or activities typical of single-impact (transient) or low-rate repeated impact vibration include impact pile drivers, blasting, drop balls, “pogo stick” compactors, and crack-and-seat equipment (California Department of Transportation 2013).

Table 4
Guideline Vibration Damage Potential Threshold Criteria

	Maximum PPV (in/sec)	
Structure and Condition	**Transient Sources**	**Continuous/Frequent Intermittent Sources**
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5

Note: Transient sources create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.
PPV = Peak Particle Velocity

Source: 2020 Caltrans Transportation and Construction Vibration Guidance Manual, Table 13.

Table 5
Guideline Vibration Annoyance Potential Criteria

	Maximum PPV (in/sec)	
Human Response	**Transient Sources**	**Continuous/Frequent Intermittent Sources**
Barely perceptible	0.40	0.01
Distinctly perceptible	0.25	0.04
Strongly perceptible	0.9	0.1
Severe	2.0	0.4

Note: Transient sources create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

PPV = Peak Particle Velocity

Local

El Dorado County General Plan

The Public Health, Safety, and Noise Element of the El Dorado County General Plan contains the County's noise-related policies. The specific policies which are generally applicable to this project are reproduced below:

Policy 6.5.1.1 Where noise-sensitive land uses are proposed in areas exposed to existing or projected exterior noise levels exceeding the levels specified in Table 6 (General Plan Table 6-1) or the performance standards of Table 7 (General Plan Table 6-2), an acoustical analysis shall be required as part of the environmental review process so that noise mitigation may be included in the project design.

Policy 6.5.1.2 Where proposed non-residential land uses are likely to produce noise levels exceeding the performance standards of Table 7 at existing or planned noise-sensitive uses, an acoustical analysis shall be required as part of the environmental review process so that noise mitigation may be included in the project design

Policy 6.5.1.3 Where noise mitigation measures are required to achieve the standards of Tables 6 and Table 7, the emphasis of such measures shall be placed upon site planning and project design. The use of noise barriers shall be considered a means of achieving the noise standards only after all other practical design-related noise mitigation measures have been integrated into the project and the noise barriers are not incompatible with the surroundings.

Policy 6.5.1.7 Noise created by new proposed non-transportation noise sources shall be mitigated so as not to exceed the noise level standards of Table 7 for noise-sensitive uses.

Policy 6.5.1.8 New development of noise sensitive land uses will not be permitted in areas exposed to existing or projected levels of noise from transportation noise sources which exceed the levels specified in Table 6 unless the project design includes effective mitigation measures to reduce exterior noise and noise levels in interior spaces to the levels specified in Table 6.

Policy 6.5.1.9 Noise created by new transportation noise sources, excluding airport expansion but including roadway improvement projects, shall be mitigated so as not to exceed the levels specified in Table 6 at existing noise-sensitive land uses.

Policy 6.5.1.11 The standards outlined in Tables 8, 9 and 10 (General Plan Tables 6-3, 6-4, 6-5) shall not apply to those activities associated with actual construction of a project as long as such construction occurs between the hours of 7:00 a.m. and 7:00 p.m., Monday through Friday, and 8:00 a.m. and 5:00 p.m. on weekends, and on federally-recognized holidays. Further, the standards outlined in Tables 8 through 10 shall not apply to public projects to alleviate traffic congestion and safety hazards.

Policy 6.5.1.12 When determining the significance of impacts and appropriate mitigation for new development projects, the following criteria shall be taken into consideration:

a) Where existing or projected future traffic noise levels are less than 60 dB DNL at the outdoor activity areas of residential uses, an increase of more than 5 dBA DNL caused by a new transportation noise source will be considered significant.

b) Where existing or projected future traffic noise levels range between 60 and 65 dBA DNL at the outdoor activity areas of residential uses, an increase of more than 3 dBA DNL caused by a new transportation noise source will be considered significant; and

c) Where existing or projected future traffic noise levels are greater than 65 dBA DNL at the outdoor activity areas of residential uses, an increase of more than 1.5 dBA DNL caused by a new transportation noise source will be considered significant.

Policy 6.5.1.13 When determining the significance of impacts and appropriate mitigation for new development projects, the following criteria shall be taken into consideration:

a) In areas in which ambient noise levels are in accordance with the standards in Table 7, increases in ambient noise levels caused by new non-transportation noise sources that exceed 5 dBA shall be considered significant; and

b) In areas in which ambient noise levels are not in accordance with the standards in Table 7, increases in ambient noise levels caused by new non-transportation noise sources that exceed 3 dBA shall be considered significant.

Table 6
Maximum Allowable Noise Exposure for Transportation Noise Sources

Land Use	Outdoor Activity Areas[1] DNL/CNEL, dB	Interior Spaces DNL/CNEL, dB	Interior Spaces L_{eq}, dB[2]
Residential	60[3]	45	--
Transient Lodging	60[3]	45	--
Hospitals, Nursing Homes	60[3]	45	--
Theaters, Auditoriums, Music Halls	--	--	35
Churches, Meeting Halls, Schools	60[3]	--	40
Office Buildings	--	--	45
Libraries, Museums	--	--	45
Playgrounds, Neighborhood Parks	70	--	--

[1] In Community Regions and Rural Centers, where the location of outdoor activity areas is not clearly defined, the exterior noise level standard shall be applied to the property line of the receiving land use. For residential uses with front yards facing the identified noise source, an exterior noise level criterion of 65 dB DNL shall be applied at the building facade, in addition to a 60 dB DNL criterion at the outdoor activity area. In Rural Regions, an exterior noise level criterion of 60 dB DNL shall be applied at a 100-foot radius from the residence unless it is within Platted Lands where the underlying land use designation is consistent with Community Region densities in which case the 65 dB DNL may apply. The 100-foot radius applies to properties which are five acres and larger; the balance will fall under the property line requirement.

[2] As determined for a typical worst-case hour during periods of use.

[3] Where it is not possible to reduce noise in outdoor activity areas to 60 dB DNL/CNEL or less using a practical application of the best-available noise reduction measures, an exterior noise level of up to 65 dB DNL/CNEL may be allowed provided that available exterior noise level reduction measures have been implemented and interior noise levels are in compliance with this table.

Maximum, L_{max}	70	60	60	55	55	50

-Each of the noise levels specified above shall be lowered by five dB for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises. These noise level standards do not apply to residential units established in conjunction with industrial or commercial uses (e.g., caretaker dwellings).
-The County can impose noise level standards which are up to 5 dB less than those specified above based upon determination of existing low ambient noise levels in the vicinity of the project site.
-In Community Regions the exterior noise level standard shall be applied to the property line of the receiving property. In Rural Areas the exterior noise level standard shall be applied at a point 100' away from the residence. The above standards shall be measured only on property containing a noise-sensitive land use as defined in Objective 6.5.1.

According to Figure LU-1 of the El Dorado County General Plan (Land Use Diagram), the project property and adjacent properties are located within a community region of the county. As a result, the noise level limits and associated criteria applicable to community regions identified in Tables 6-8 would be applicable to the project.

<u>El Dorado County Municipal Code</u>

The provisions of the El Dorado County Municipal Code which would be most applicable to this project are reproduced below.

130.37.020 Exemptions

The following noise sources shall be exempt from the standards of this Chapter:

A. Activities conducted in public parks, public playgrounds, and public or private school grounds, including but not limited to school athletic and school entertainment events, providing an amplified sound system is not required or used.

B. The use of any mechanical device, apparatus, or equipment related to or connected with emergency activities or emergency work to protect life or property.

C. Safety signals, warning devices, and emergency pressure relief valves properly operated and in good working order.

D. Noise sources associated with property maintenance, such as lawn mowers, trimmers, snow blowers, power tools in good working order, and cutting of firewood for non-commercial personal use, provided that the activities take place between the hours of eight a.m. and nine p.m. on weekdays and nine a.m. to nine p.m. on weekends and federal holidays.

E. Noise sources associated with agricultural uses listed in Section 130.21.020 (Agricultural Zones: Matrix of Allowed Uses) in Article 2 (Zones, Allowed Uses, and Zoning Standards) of this Title that are performed consistent with the standards and practices of the agricultural industry.

F. Noise sources associated with work performed by public or private utilities in the maintenance or modification of its facilities.

G. Noise sources associated with public holidays, or other commonly celebrated occasions.

H. Traffic on public roadways, railroad line operations, aircraft in flight, and any other activity where regulation thereof has been preempted by state or federal law.

I. Construction (e.g., construction, alteration or repair activities) during daylight hours provided that all construction equipment shall be fitted with factory installed muffling devices and maintained in good working order.

130.37.060 Noise Standards.

The following standards shall apply to all development projects for which an acoustic analysis is required:

A. Noise sensitive land uses affected by non-transportation noise sources shall not exceed standards set forth in Table 11 (MC Table 130.37.060.1) provided below:

Table 11
Noise Level Performance Standards for Noise-Sensitive Land Uses Affected by Non-Transportation Sources

	Daytime (7am – 7pm)		Evening (7pm – 10pm)		Nighttime (10pm – 7am)	
Noise Level Descriptor	**Community**	**Rural**	**Community**	**Rural**	**Community**	**Rural**

Maximum level (L_{max}), dB	70	60	60	55	55	50

Source: El Dorado County Municipal Code, Section 130.37.060.

1. Each of the noise levels specified above shall be lowered by five dBA for simple tone noises, noises consisting primarily of unamplified speech or music, or for recurring impulsive noises. These noise level standards do not apply to residential units established in conjunction with industrial or commercial uses, such as caretaker dwellings.
2. The Director can impose noise level standards which are up to five dBA less than those specified above, based upon a -determination of existing low ambient noise levels in the vicinity of the project site.
3. The exterior noise level standard shall be applied as follows:
   a. In Community Regions, at the property line of the receiving property;
   b. In Rural Centers and Regions, at a point 100 feet away from a sensitive receptor or, if the sensitive receptor is within the Platted Lands Overlay (-PL) where the underlying land use designation is consistent with Community Region densities, at the property line of the receiving property or 100 feet away from the sensitive receptor, whichever is less; or
   c. In all areas, at the boundary of a recorded noise easement between affected properties

B. Transportation noise shall not exceed thresholds set forth in Table 12 (MC Table 130.37.060.2) provided below:

Table 12
Noise Level Standards for Noise-Sensitive Land Uses Affected by Transportation Noise Sources

Land Use	Outdoor Activity Areas[1] DNL/CNEL, dB	Interior Spaces	
		DNL/CNEL, dB	L_{eq}, dB
Residential	60	45	--
Transient Lodging	60	45	--
Hospitals, Nursing Homes	60	45	--
Theaters, Auditoriums, Music Halls	--	--	35
Churches, Meeting Halls, Schools	60	--	40
Office Buildings	--	--	45
Libraries, Museums	--	--	45
Playgrounds, Neighborhood Parks	70	--	--

Source: El Dorado County Municipal Code, Section 130.37.060.2.

1. In Community Regions and Rural Centers:
   a. Where the location of outdoor activity areas is not clearly defined, the exterior noise level standard shall be applied at the property line of the sensitive receptor.
   b. For residential uses with front yards facing the identified noise source, an exterior noise level threshold of 65 dBA DNL shall be applied at the dwelling facade in addition to the required threshold at the outdoor activity area.

2. In Rural Regions: An exterior noise level threshold of 60 dBA DNL shall be applied at a 100-foot radius from the dwelling on lots five acres and larger. Those lots less than five acres shall have the noise level standards applied at the property line.
3. Where it is not possible to reduce noise levels in those outdoor activity areas limited to 60 dBA DNL/CNEL thresholds using a practical application of the best-available noise reduction measures, an exterior noise threshold of up to 65 dBA DNL/CNEL may be allowed provided that available exterior noise level reduction measures have been implemented and interior noise levels are in compliance with this table.

C. Construction-related noise shall allow for exceptions to the evening and nighttime standards or other temporary exceedances of noise standards as may be approved by the Director, where necessary to alleviate traffic congestion and safety hazards, or where authorized by an approved permit.

Impacts and Mitigation Measures

Thresholds of Significance

For the purposes of this assessment, a noise and vibration impact is considered significant if the project would result in:

- Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or other applicable standards of other agencies; or
- Generation of excessive groundborne vibration or groundborne noise levels; or
- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels.

The project site is not within the vicinity of a private airstrip, an airport land use plan, or within two miles of a public airport. Therefore, the last threshold listed above is not discussed further.

The following criteria based on standards established by the California Department of Transportation (Caltrans) and El Dorado County General Plan were used to evaluate the significance of environmental noise and vibration resulting from the project:

- A significant noise impact would be identified if the project would expose persons to or generate noise levels that would exceed applicable noise standards presented in the El Dorado County General Plan or El Dorado County Municipal Code.
- A significant impact would be identified if off-site traffic noise exposure or on-site activities generated by the project would substantially increase noise levels at existing sensitive receptors in the vicinity. A substantial increase would be identified relative to the noise level increase significance criteria established in Policies 6.5.1.12 (transportation noise

sources) and 6.5.1.13 (non-transportation noise sources) of the El Dorado County General Plan.

- A significant impact would be identified if project construction activities or proposed on-site operations would expose noise-sensitive receptors to excessive groundborne vibration levels. Specifically, an impact would be identified if groundborne vibration levels due to these sources would exceed the Caltrans vibration impact criteria.

Noise Impacts Associated with Project-Generated Increases in Off-Site Traffic

With development of the project, traffic volumes on the local roadway network will increase. Those increases in daily traffic volumes will result in a corresponding increase in traffic noise levels at existing uses located along those roadways. Impacts 1 & 2 evaluate increases in off-site traffic noise levels which would result from the project.

Impact 1: Increases in Existing Traffic Noise Levels due to the Project

The FHWA Traffic Noise Model (FHWA-RD-77-108) was used to quantify increases in existing traffic noise levels at the existing sensitive land uses nearest to the project area roadway network. The FHWA Model predicts hourly L_{eq} values for free-flowing traffic conditions. Estimates of the hourly distribution of traffic for a typical 24-hour period were used to develop DNL values from L_{eq} values.

Traffic data in the form of peak hour intersection turning movements were obtained from the traffic impact analysis prepared by the project transportation consultant (T. Kear Transportation Planning & Management, Inc.). Those data were converted to Average Daily Traffic (ADT) segment volumes by applying a factor of 5 to the sum of AM and PM peak hour conditions. Other inputs were obtained from BAC observations and noise measurement data. Appendices B-1 and B-2 contain the FHWA Model inputs for existing and existing plus project conditions, respectively. The existing and existing plus project traffic noise levels at the distances representing the nearest noise-sensitive land uses to the project area roadways are summarized in Table 13. Table 13 also shows the thresholds for determination of a significant traffic noise increase, whether the roadway segment contains sensitive uses, and whether or not significant noise impacts are identified for each segment.

It should be noted that the FHWA Model predictions presented in Table 13 are based on inputs that include weekday peak hour traffic volumes, day/night, and truck type percentages (e.g., medium and heavy trucks), vehicle speed, and distance from roadway centerlines. The FHWA Model does not account for non-traffic ambient noise sources such as nearby wildlife (e.g., birds chipping) or other anthropogenic noise sources within an area (e.g., distant traffic from other roadways, recreational activities, commercial or industrial operations, etc.).

[1] Significance thresholds established in General Plan Policy 6.5.1.12.
[2] Sensitive receptors identified as existing residential, school or church uses.
[3] A significant impact is identified only along segments where the project-related traffic noise level increase would exceed threshold AND where sensitive receptors are present along the roadway segment.
[4] Project traffic study did not contain data for segments 19, 21 and 22, which are access points to the project property (located within the project area). For the purposes of this analysis, the measured ambient DNL at BAC site 4 was utilized, which is believed to be representative of the existing ambient noise level environment along those roadway segments.

Source: FHWA-RD-77-108 with inputs from T. Kear Transportation Planning & Management. Appendices B-1 & B-2 contain FHWA Model inputs.

Based on the analyses presented in Table 13, project-generated traffic noise level increases would not result in significant noise impacts at existing noise-sensitive receptors located along the project area roadway network relative to the increase significance criteria contained in Policy 6.5.1.12 of the El Dorado County General Plan. As a result, this impact is identified as being ***less than significant***.

Impact 2: Increases in Cumulative Traffic Noise Levels due to the Project

The FHWA Traffic Noise Model (FHWA-RD-77-108) was used within inputs obtained from the traffic impact analysis prepared by the project transportation consultant (T. Kear Transportation Planning & Management, Inc.) to quantify increases in future (cumulative) traffic noise levels at the nearest existing noise-sensitive land uses to the project area roadway network. This analysis first assesses whether a cumulative roadway noise impact would occur by comparing the cumulative with project conditions to existing conditions, which is presented in Table 14. If a cumulative roadway noise impact is identified, it is further evaluated to assess whether the proposed project would make a cumulatively considerable contribution to the cumulative impact. This process is completed through a comparison of the roadway noise associated with the cumulative with project scenario against the cumulative no-project scenario, which is shown in Table 15. Appendices B-3 and B-4 contain the FHWA Model inputs for cumulative and cumulative plus project conditions, respectively.

Table 14
Predicted Traffic Noise Level Increases at Existing Noise-Sensitive Receptors – Existing (2023) vs. Cumulative (2040) Plus Project Conditions

Source: FHWA-RD-77-108 with inputs from T. Kear Transportation Planning & Management. Appendices B-3 & B-4 contain FHWA Model inputs.

As indicated in Table 14, project-generated traffic is calculated to exceed the applicable General Plan Policy 6.5.1.12 impact significance criterion along one roadway segment containing a noise-sensitive receptor (segment 29). However, the project-generated increase along that roadway segment is not calculated to have a cumulatively considerable contribution to the cumulative impact relative to the General Plan Policy 6.5.1.12 criterion (Table 15).

Based on the analyses presented in Tables 14 and 15, project-generated traffic noise level increases would not result in significant noise impacts at existing noise-sensitive receptors located along the project area roadway network relative to the increase significance criteria contained in Policy 6.5.1.12 of the El Dorado County General Plan. As a result, this impact is identified as being ***less than significant***.

Impact 3: Increases in Project-Generated Traffic Noise Levels at Existing Schools

As mentioned previously, traffic volumes on the local roadway network will increase with development of the project. Those increases in daily traffic volumes will result in a corresponding increase in traffic noise levels at existing uses located along those roadways – which would include schools.

Existing and cumulative increases in off-site traffic noise levels which would result from the project were evaluated in **Impacts 1 and 2**. As indicated in Table 13, existing plus project increases in traffic noise levels at the outdoor area/playground of the nearest existing school along the project roadway network (John Hancock Academy, roadway segment 28) were calculated to be less than 0.1 dB DNL. In addition, Table 14 data indicates that cumulative plus project increases in traffic noise levels at the outdoor area/playground of the closest existing school within project roadway network (John Hancock Academy, roadway segment 28) were calculated to be 0.6 dB DNL. The threshold of perception of the human ear is approximately 3 to 5 dB – a 5 dB change is considered to be clearly noticeable. Further, when considering a doubling of traffic volumes, which is unlikely to occur within the local roadway network, would result in a logarithmic increase of 3 dB. The calculated range of project-generated increases in ambient noise levels at the closest schools within the project roadway network (0.1 dB DNL to 0.6 dB DNL) would be well below the threshold of human perception.

Based on the analysis provided in this report and the information above, project-generated increases in traffic noise levels are not expected to result in significant increases in ambient noise levels at existing outdoor areas of schools within the local roadway network (Latrobe School District). As a result, this impact is identified as being ***less than significant***.

Off-Site Noise Impacts Associated with Proposed On-Site Activities

The proposed project consists of approximately 918 dwelling units, one village and two neighborhood parks, approximately 46-acres of open space, and a 1.8-acre commercial component. The primary noise sources associated with proposed uses of the development have been identified as park and commercial activities. An assessment of project-related park and commercial activity noise levels at the nearest existing noise-sensitive uses follows.

Section 130.37.020 of the El Dorado County Municipal Code provides an exemption for noise from activities conducted in parks, such as those proposed by the project. As a result, an impact discussion for project park noise at existing noise-sensitive uses relative to Municipal Code noise level criteria is not included in this assessment. Rather, this assessment provides an analysis of project park noise at existing off-site uses relative to the applicable El Dorado County General Plan noise level limits.

Impact 4: Park Activity Noise at Nearest Existing Noise-Sensitive Uses

According to the project site plans, the project proposes three (3) parks. Specifically, the project proposes one large Village Park and two smaller Neighborhood Parks. The locations of the proposed parks are shown in Figure 2.

Noise generated by parks vary depending on whether the parks are intended for passive or active use. Passive use includes picnic and sitting areas whereas active use incudes playing fields and play structures. Based on information contained in the Public Facilities and Services Chapter of the Creekside Village Specific Plan, the proposed Village and Neighborhood Parks will have both passive and active uses. According to BAC file data, parks consisting of active uses (playing fields / playgrounds) have noise levels of approximately 60 dB L_{eq} and 70 dB L_{max} at a distance of 50 feet.

The nearest existing noise-sensitive uses to a proposed park have been identified as residences constructed along Latrobe Road east of the development (adjacent to the Village Park, identified in Figure 2). Based on the reference noise levels presented above, and assuming standard spherical spreading loss (-6 dB per doubling of distance), park activity noise exposure at the nearest existing noise-sensitive uses was calculated. The results of those calculations are provided in Table 16.

Because park activities would likely consist of human speech (i.e., shouting and cheering during activities), noise associated with park activities would be subject to the El Dorado County General Plan's more restrictive daytime, evening, and nighttime noise level standards for community regions shown in Table 7 (the criteria contain a 5 dB penalty for noise consisting primarily of speech). However, it is reasonable to assume that park hours would be likely be restricted to daytime and evening hours only (7:00 a.m. to 10:00 p.m.). Satisfaction with the General Plan's more restrictive evening noise level standards would ensure for compliance with the General Plan's less restrictive daytime noise level limits. Therefore, project park noise exposure at the nearest existing noise-sensitive uses was assessed relative to the applicable General Plan evening noise level standards for community regions shown in Table 7.

Table 16
Predicted Park Activity Noise Levels at Nearest Existing Noise-Sensitive Uses

			Predicted Noise Levels (dB)[4]		County Evening Noise Standards (dB)	
Receiver[1]	**Nearest Park[2]**	**Distance (ft)[3]**	**L_{eq}**	**L_{max}**	**L_{eq}**	**L_{max}**
Residential – East	Village	450	33	43	45	55

[1] Locations of existing residences are shown in Figure 2.
[2] Locations of proposed park areas are shown in Figure 2.
[3] Distances measured from effective noise center of nearest park to nearest residential property line.
[4] Predicted park activity noise levels at the nearest existing residences include consideration of the shielding that would be provided by existing 8' traffic noise barriers along the property lines of those residences, and have been adjusted by -8 dB. Figure 2 shows the location of the existing traffic noise barriers.

Source: BAC 2020.

As indicated in Table 16, project park noise level exposure is predicted to satisfy the applicable El Dorado County General Plan evening noise level standards at the nearest existing noise-sensitive uses (single-family residential uses to the east of the project).

In addition, the predicted park activity noise levels shown in Table 16 are well below ambient daytime (7:00 a.m. to 10:00 p.m.) noise levels measured within close proximity to the nearest residential uses to the east of the park (BAC ambient measurement site 3). Based on this information, increases in ambient daytime and evening noise levels at the nearest existing sensitive uses due to project park activities would not be significant relative to the criteria contained in General Plan Policy 6.5.1.13.

Because project park activity noise exposure is predicted to satisfy the applicable El Dorado County General Plan noise level standards at the nearest existing sensitive uses (residential), and because increases in ambient noise levels due to project park activity noise levels at those locations would not be significant relative to the General Plan Policy 6.5.1.13 criteria, this impact is considered to be ***less than significant***.

Impact 5: Commercial Operations Noise at Nearest Existing Noise-Sensitive Uses

The project site plan indicates that a 1.8-acre commercial component (Neighborhood Commercial – NC) will be included in the site design. The location of the proposed commercial component is shown in Figure 2. A complete list of allowed commercial uses within the component is provided below:

-Building supply store
-Banks and financial services
-Bars and drinking establishments
-Brewpub
-Child day care center
-Community care facility
-Drive-through facility
-Offices: professional
-Pet grooming
-Research and laboratory services
-Restaurant
-Retail sales and services
-Specialized education and training
-Veterinary clinic

-Food and beverage retail
-Medical services: clinic
-Mixed-use dwelling
-Offices: medical
-Automotive: fuel sales (CUP required)
-Microbrewery (CUP required)
-Nursery retail (CUP required)
-Winery: full-service facilities (CUP required)

As indicated above, the automotive (w/fuel sales), microbrewery, nursery/retail, and winery (full-service facilities) uses would trigger the need for a county conditional use permit (CUP). It is reasonably assumed that specific noise studies would be required for each of those uses as part of the county's CUP approval process at a later point in time. Based on this assumption, further consideration of noise sources associated with the automotive (w/fuel sales), microbrewery, nursery/retail, and winery uses within the proposed commercial component of the development were not included in this discussion. The primary noise sources associated with the remaining allowable commercial uses in the list above have been identified as parking movements, truck delivery activities, drive-through operations, childcare outdoor play area activities, building mechanical equipment (i.e., HVAC), and forklift operations.

Although the tentative map plan contains the general location of the planned commercial component within the development, detailed plans illustrating locations of specific uses within those components have not yet been developed. It is expected that detailed development plans for the commercial component will be reviewed at a future date as part of the county's project approval process. As a result, the following section provides a generalized analysis of commercial operations noise exposure at nearby existing noise-sensitive uses.

Parking Lot Movements

As a means of determining potential noise exposure due to commercial component parking lot activities, BAC utilized specific parking lot noise level measurements conducted by BAC. Specifically, a series of individual noise measurements were conducted of multiple vehicle types arriving and departing a parking area, including engines starting and stopping, car doors opening and closing, and persons conversing as they entered and exited the vehicles. The results of those measurements revealed that individual parking lot movements generated mean noise levels of 65 dB SEL and 65 dB L_{max} at a reference distance of 50 feet.

For a conservative assessment of parking area noise generation, it was assumed that a parking area within the commercial component could accommodate up to 200 vehicles. This estimate of vehicle capacity was based on review of the tentative map plan shown in Figure 2 and the use types envisioned within the commercial component. It was also assumed that a parking area could fill or empty during any given peak hour of business operations. Using BAC parking lot noise measurement data and based on the operations assumptions above, noise exposure from an individual parking area having 200 vehicle stalls computes to approximately 52 dB L_{eq} and 65 dB L_{max} at a distance of 50 feet from the effective noise center of the area.

Truck Delivery Activities

It is the experience of BAC that deliveries of product to commercial uses such as the ones allowed within the commercial component occur are typically done with medium-duty vendor trucks/vans. The primary noise sources associated with delivery activities are trucks stopping (air brakes), trucks backing into position (back-up alarms), and pulling away from the loading/unloading area

(revving engines). BAC file data indicate that noise levels associated with medium-duty truck deliveries (including side-step vans) are approximately 76 dB SEL and 66 dB L_{max} at a distance of 100 feet.

For a conservative assessment of commercial component delivery truck noise generation, it was assumed that 5 medium duty trucks/vans would deliver products to the store on a typical busy day. To compute delivery truck activity noise exposure relative to the county's hourly average (L_{eq}) noise descriptor, it was assumed that 3 truck deliveries could occur with the same given hour. Using the BAC noise measurement data and operations assumptions above, noise exposure from 3 truck deliveries computes to approximately 45 dB L_{eq} at a distance of 100 feet (maximum noise level of 66 dB L_{max}).

Drive-Through Operations

It is the experience of BAC that the primary noise sources associated with drive-through operations are the amplified menu speaker board/post and vehicle passages. To quantify the noise emissions of drive-through operations, BAC utilized noise measurement data collected for similar drive-through operations in the greater Sacramento area in recent years. The BAC file data indicate that drive-through speakers were measured to have average and maximum noise levels of approximately 60 dB L_{eq} and 67 dB L_{max} (respectively) at a distance of 10 feet. BAC file data further indicate that vehicles within drive-throughs were measured to have average and maximum noise levels of 57 dB L_{eq} and 70 dB L_{max} (respectively) at a distance of 5 feet.

Playground Activities

It is reasonably assumed that child care uses within the commercial component (should they be development) would have an outdoor play area. For the assessment of play area noise impacts, noise level data collected by BAC staff at various outdoor playgrounds in recent years was utilized. The primary noise source associated with play area use is shouting children. BAC file data indicate that average and maximum noise levels are approximately 55 dB L_{eq} and 75 dB L_{max} at a distance of 50 feet from the focal point of the playground area.

HVAC Equipment

The HVAC systems within future buildings of the commercial component will likely consist of packaged rooftop air conditioning systems. Such HVAC units, which typically stand about 4-5 feet tall, would be shielded from view of nearby sensitive uses by the building parapets. It is the experience of BAC that such rooftop HVAC units frequently generate a noise level of approximately 45 dB L_{eq} at a reference distance of 100 feet from the building facade, including shielding by the building parapet (estimated to provide approximately 10 dB of noise level reduction).

Forklift Activities

According the list of allowed commercial uses within the commercial development, it is expected that the building supply store and winery uses would have forklift operations for moving deliveries of product. To quantify the noise emissions of forklift activities, BAC utilized noise measurement data collected from commercial forklift operations. Those data indicate that average and

maximum noise levels for forklift loading/ unloading operations can be expected to be approximately 67 dBA L_{eq} and 82 dBA L_{max} (respectively) at a distance of 10 feet from the operating forklift.

Predicted Commercial Operations Noise Levels at Existing Noise-Sensitive Uses

Based on the reference noise level data and operations assumptions presented above, and assuming standard spherical spreading loss (-6 dB per doubling of distance), commercial operations noise exposure at the nearest existing noise-sensitive uses was calculated. The results of those calculations are presented in Tables 17 and 18. The nearest existing noise-sensitive uses to the commercial component have been identified as residences constructed along Latrobe Road east of the development.

Table 17
Predicted Commercial Noise Levels at Nearest Existing Noise-Sensitive Uses – Hourly L_{eq}

	Predicted Noise Level, L_{eq} (dB)[2,3]						
Receiver[1]	Parking (250')	Truck Delivery (250')	Drive-Thru (200')	Playground (200')	HVAC (200')	Forklift (200')	Cumulative[4]

Figure 2 shows the location of the existing traffic noise barriers.
[4] Highest predicted maximum noise level from analyzed commercial operations/activities.

Source: BAC 2023.

According to the data presented in Tables 17 and 18, commercial operations noise level exposure is predicted to satisfy the applicable El Dorado County General Plan daytime, evening, and

nighttime hourly average (L_{eq}) and maximum (L_{max}) community noise level criteria at the nearest existing noise-sensitive uses (single-family residential uses to the east of the project).

Additionally, the predicted commercial operations noise levels shown in Tables 17 and 18 are well below ambient daytime, evening, and nighttime noise levels measured within close proximity to the nearest residential uses to the east of the park (BAC ambient measurement site 3). Based on this information, increases in ambient daytime, evening, and nighttime noise levels at the nearest existing sensitive uses due to project commercial activities would not be significant relative to the criteria contained in General Plan Policy 6.5.1.13.

Based on the analysis and results provided above, noise level exposure from the analyzed commercial operations is predicted to satisfy the applicable El Dorado County General Plan noise level standards at the nearest existing sensitive uses (residential). Further, increases in ambient noise levels from those operations at the nearest existing sensitive uses would not be significant relative to applicable General Plan Policy 6.5.1.13 criteria. As a result, this impact is considered to be ***less than significant***.

Noise Impacts Associated with Proposed Off-Site Infrastructure Improvements

The project proposes off-site improvements associated with transportation and utility infrastructure. The overall area of potential effect (APE) for the improvements is presented in Appendix F. The off-site infrastructure improvements include:

- Improvement I: Intersection improvements at Latrobe Road/Town Center Boulevard (turn lane extension, roadway re-paving and re-striping)
- Improvement II: Roadway improvements at Royal Oaks Drive/Latrobe Road and Avanti Drive/Latrobe Road intersections (intersection signalization and roadway re-striping)
- Improvement III: Transportation improvements (roadway and bicycle access connection, and waterline connection)
- Improvement IV: Infrastructure improvements (wastewater force main extension)

During the infrastructure improvements, noise from heavy equipment operations would add to the noise environment in the immediate project vicinity.

Impact 6: Off-Site Infrastructure Improvement Noise at Existing Noise-Sensitive Uses

Heavy equipment associated with project off-site infrastructure improvement activities would increase ambient noise levels when in use. Noise levels would vary depending on the type of equipment used, how it is operated, and how well it is maintained. Noise exposure at any single point outside the project work area would also vary depending upon the proximity of equipment activities to that point.

The nearest existing noise-sensitive receptors to the off-site infrastructure improvement work areas have been identified as residences along Latrobe Road – located as close as 150 feet away from the acoustic noise center of the Improvement II work areas. However, it should be noted

that those nearest residences have existing property line noise barriers that would provide screening of work area noise levels.

Table 19 includes the range of maximum noise levels for equipment commonly used in roadway improvement projects at full-power operation at a distance of 50 feet. The Table 19 data also include predicted maximum equipment noise levels at the nearest identified sensitive receptor to an off-site infrastructure improvement work area located approximately 150 feet away, which assume a standard spherical spreading loss of 6 dB per doubling of distance.

It should be noted that average noise levels associated with construction activities are dependent upon equipment type, duration of activity, and location within a given work area, and therefore tend to be highly variable. As a result, this analysis focuses on maximum noise levels associated with construction equipment only.

Table 19
Typical Construction Equipment Noise – Roadway Improvement Projects

Equipment Description	Typical Maximum Noise Level at 50 Feet (dBA)	Predicted Maximum Noise Level at 150 Feet (dBA)
Concrete mixer truck	85	75
Concrete saw	90	80
Dump truck	84	74
Flatbed truck	84	74
Front end loader	80	70
Generator (more than 25 kVA)	82	72
Paver	85	75
Pickup truck	55	45

Source: 2018 Federal Transit Administration Noise and Vibration Impact Assessment Manual, Table 7-1.

Based on the equipment noise levels in Table 19, maximum noise levels from construction equipment are predicted to range from 45 to 80 dB at a distance of 150 feet – the distance from the acoustical noise center of the nearest work area to the nearest residence. Although it is expected that existing noise barriers along the property lines of the nearest residences to the work areas would reduce equipment noise levels at those locations, it is possible that a portion of the heavy equipment associated with project infrastructure improvements could result in temporary short-term increases over ambient maximum noise levels at those residences. Further, it is possible that those noise levels could exceed the applicable El Dorado County noise level limits.

Policy 6.5.1.11 of the El Dorado County General Plan exempts noise sources associated with construction provided such activities take place between the hours of 7:00 a.m. and 7:00 p.m., Monday through Friday, and 8:00 a.m. and 8:00 p.m. on weekends, and on federally recognized holidays. Section 130.37.20 of the El Dorado County Municipal Code also provides an exemption for construction noise provided that such activities occur during daylight hours and that all equipment is fitted with factory installed muffling devices and maintained in good working order. Provided that project roadway improvement construction activities occur pursuant to the criteria identified in General Plan Policy 6.5.1.11 and Municipal Code Section 130.37.20, noise from those project-generated activities would be exempt, and this impact would be considered less than

significant. However, if construction activities are proposed during the hours/days not exempted by the General Plan or Municipal Code, noise levels generated by project roadway improvement construction activities could exceed the maximum noise level standards identified in Table 8 at the nearest existing residential uses. As a result, noise impacts associated with project on-site construction activities are identified as being **potentially significant**.

Mitigation for Impact 6: Construction Noise Control Measures

MM-6: To the maximum extent practical, the following construction-related measures should be incorporated into the project off-site infrastructure improvement operations:

- Noise-generating infrastructure improvement construction activities should occur between the hours of 7:00 a.m. and 7:00 p.m., Monday through Friday, and 8:00 a.m. and 5:00 p.m. on weekends and on federal holidays.
- All noise-producing project equipment and vehicles using internal-combustion engines shall be equipped with manufacturers-recommended mufflers and be maintained in good working condition.
- All mobile or fixed noise-producing equipment used on the project site that are regulated for noise output by a federal, state, or local agency shall comply with such regulations while in the course of project activity.
- Electrically powered equipment shall be used instead of pneumatic or internal-combustion-powered equipment, where feasible.
- Material stockpiles and mobile equipment staging, parking, and maintenance areas shall be located as far as practicable from noise-sensitive uses.
- Nearby residences shall be notified of construction schedules so that arrangements can be made, if desired, to limit their exposure to short-term increases in ambient noise levels.

Significance of Impact 6 after Mitigation: ***Less than Significant***

Noise Impacts Associated with Project On-Site Construction Activities

Impact 6: On-Site Construction Noise Levels at Existing Sensitive Uses

During project construction, heavy equipment would be used for grading excavation, paving, and building construction, which would increase ambient noise levels when in use. Noise levels would vary depending on the type of equipment used, how it is operated, and how well it is maintained. Noise exposure at any single point outside the project work area would also vary depending upon the proximity of equipment activities to that point. The property boundary of the nearest existing residential use (east of Latrobe Road) is located approximately 200 feet away from where construction activities would occur within the project area.

Table 20 includes the range of maximum noise levels for equipment commonly used in general construction projects at full-power operation at a distance of 50 feet. Not all of these construction activities would be required of this project. The Table 20 data also include predicted maximum

equipment noise levels at the boundary of the nearest sensitive use located approximately 200 feet away, which assume a standard spherical spreading loss of 6 dB per doubling of distance.

Table 20
Construction Equipment Reference Noise Levels and Predicted Noise Levels at 200 Feet

Equipment Description	Maximum Noise Level at 50 Feet (dBA)	Predicted Maximum Noise Level at 200 feet (dBA)
Air compressor	80	68
Backhoe	80	68
Ballast equalizer	82	70
Ballast tamper	83	71
Compactor	82	70
Concrete mixer	85	73
Concrete pump	82	70
Concrete vibrator	76	64
Crane, mobile	83	71
Dozer	85	73
Generator	82	73
Grader	85	70
Impact wrench	85	73
Loader	80	73
Paver	85	68
Pneumatic tool	85	73
Pump	77	73
Saw	76	65
Scarifier	83	64
Scraper	85	71
Shovel	82	73
Spike driver	77	70
Tie cutter	84	65
Tie handler	80	72
Tie inserter	85	68
Truck	84	73

Source: 2018 Federal Transit Administration Noise and Vibration Impact Assessment Manual, Table 7-1.

Based on the equipment noise levels in Table 20, worst-case on-site project construction equipment maximum noise levels at the nearest existing residential use located 200 feet away are expected to range from approximately 64 to 73 dB. However, the predicted project construction equipment maximum noise levels of 64 to 73 dB are below ambient daytime maximum noise levels measured within close proximity to those residences (BAC ambient measurement site 3). Further, it is expected that existing traffic noise barriers along the property boundaries of those nearest residential uses would further reduce project construction noise levels at those locations (the existing barriers are illustrated in Figure 2). However, it is possible that worst-case one-site project construction noise levels could exceed the applicable El Dorado County General Plan noise level limits applicable to construction noise in community regions identified in Table 8, including consideration of the existing noise barriers.

Policy 6.5.1.11 of the El Dorado County General Plan exempts noise sources associated with construction provided such activities take place between the hours of 7:00 a.m. and 7:00 p.m., Monday through Friday, and 8:00 a.m. and 8:00 p.m. on weekends, and on federally recognized holidays. Section 130.37.20 of the El Dorado County Municipal Code also provides an exemption

for construction noise provided that such activities occur during daylight hours and that all equipment is fitted with factory installed muffling devices and maintained in good working order. Provided project construction activities occur during these hours/days, construction activities would be exempt, and this impact would be considered less than significant. However, if construction activities are proposed during the hours not exempted by the General Plan or Municipal Code, noise levels generated by construction activities could exceed the maximum noise level standards identified in Table 8 at the nearest existing residential uses. As a result, noise impacts associated with project on-site construction activities are identified as being **potentially significant**.

Mitigation for Impact 7: On-Site Construction Noise Control Measures

MM-7: To the maximum extent practical, the following measures should be incorporated into the project on-site construction operations:

- Noise-generating infrastructure improvement construction activities should occur between the hours of 7:00 a.m. and 7:00 p.m., Monday through Friday, and 8:00 a.m. and 5:00 p.m. on weekends and on federal holidays.
- All noise-producing project equipment and vehicles using internal-combustion engines shall be equipped with manufacturers-recommended mufflers and be maintained in good working condition.
- All mobile or fixed noise-producing equipment used on the project site that are regulated for noise output by a federal, state, or local agency shall comply with such regulations while in the course of project activity.
- Electrically powered equipment shall be used instead of pneumatic or internal-combustion-powered equipment, where feasible.
- Material stockpiles and mobile equipment staging, parking, and maintenance areas shall be located as far as practicable from noise-sensitive uses.
- Project area and site access road speed limits shall be established and enforced during the construction period.
- Nearby residences shall be notified of construction schedules so that arrangements can be made, if desired, to limit their exposure to short-term increases in ambient noise levels.

Significance of Impact 7 after Mitigation: ***Less than Significant***

Vibration Impacts Associated with Project Activities

Impact 8: Vibration Generated by Project Construction and On-Site Operations

During project construction, heavy equipment would be used for grading, excavation, paving, and building construction, which would generate localized vibration in the immediate vicinity of the construction. The nearest identified existing structures (residences east of Latrobe Road) are located approximately 215 feet from where from construction activities which would occur within the project area.

Table 21 includes the range of vibration levels for equipment commonly used in general construction projects at a distance of 25 feet. The Table 21 data also include predicted equipment vibration levels at the nearest existing residences to the project area located approximately 215 feet away.

Table 21
Vibration Source Levels for Construction Equipment and Predicted Levels at 215 Feet

Equipment	Maximum Vibration Level at 25 Feet (PPV)[1]	Predicted Maximum Vibration Level at 215 Feet (PPV)
Large bulldozer	0.089	0.004
Hoe ram	0.089	0.004
Caisson drilling	0.089	0.004
Loaded trucks	0.076	0.003
Backhoe	0.051	0.002
Excavator	0.051	0.002
Grader	0.051	0.002
Loader	0.051	0.002
Jackhammer	0.035	0.001
Small bulldozer	0.003	<0.001

[1] PPV = Peak Particle Velocity

Source: 2018 FTA Transit Noise and Vibration Impact Assessment Manual and BAC calculations

As shown in Table 21, vibration levels generated from on-site construction activities at the nearest existing structures located approximately 215 feet away (residences east of Latrobe Road) are predicted to be well below the Caltrans thresholds for damage to new residential structures of 0.5 in/sec PPV shown in Table 4. In addition, the predicted vibration levels in Table 21 are well below the threshold for a barely perceptible human response as defined by Caltrans in Table 5 (vibration damage potential threshold criteria). Therefore, on-site construction within the project area is not expected to result in excessive groundborne vibration levels at nearby existing residential uses.

Results from the ambient vibration level monitoring at the project site (Table 3) indicate that measured average vibration levels were well below the strictest Caltrans thresholds for damage to structures and thresholds for annoyance. Therefore, it is expected that the project would not result in the exposure of persons to excessive groundborne vibration levels at proposed uses of the project.

The project proposes residential and park uses within the development. It is the experience of BAC these uses do not typically have equipment that generates appreciable vibration. Further, it is our understanding that the project does not propose equipment that will produce appreciable vibration.

Because vibration levels due to and upon the proposed project are expected to satisfy the applicable Caltrans groundborne impact vibration criteria, this impact is considered to be ***less than significant***.

Impact 9: Vibration Generated by Off-Site Infrastructure Improvements

During project off-site infrastructure improvements, heavy equipment would be used, which would generate localized vibration in the immediate vicinity of the construction. The worst-case vibration exposure from off-site heavy equipment activities would occur at the sensitive receptors (residences) located along Latrobe Road – located as close as 110 feet away from Improvement II work areas.

According to the reference vibration levels for construction equipment presented in Table 21, vibration levels associated with typical construction equipment range from 0.003 to 0.089 PPV at a distance of 25 feet. When projected to the nearest existing residence located near an off-site infrastructure improvement work area approximately 110 feet away, construction equipment vibration levels are calculated to range from less than 0.001 to 0.010 PPV. The calculated vibration levels of less than 0.001 to 0.010 PPV are well below the Caltrans thresholds for damage to new residential structures of 0.5 in/sec PPV shown in Table 4. In addition, the calculated vibration levels are below the threshold for a barely perceptible human response as defined by Caltrans in Table 5 (vibration damage potential threshold criteria).

Because vibration level exposure due to project off-site infrastructure improvements would satisfy the Caltrans groundborne impact vibration criteria, this impact is considered to be ***less than significant***

Noise Impacts Upon the Development

The California Supreme Court issued an opinion in *California Building Industry Association v. Bay Area Air Quality Management District (2015)* holding that CEQA is primarily concerned with the impacts of a project on the environment and generally does not require agencies to analyze the impact of existing conditions on a project's future users or residents. Nevertheless, El Dorado County has policies that address existing/future conditions affecting the proposed project, which are discussed in the following section.

On-Site Traffic Noise Impacts

Impact 10: Future Exterior Traffic Noise Levels at Proposed Residential and Park Uses

The FHWA Model was used with future traffic data to predict future traffic noise levels at the residential and park uses of the development. The future (Cumulative 2040 Plus Project) average daily traffic (ADT) volume for Latrobe Road was calculated using data provided in the project

transportation impact analysis completed by T. Kear Transportation Planning & Management, Inc. Specifically, the future Latrobe Road average daily traffic (ADT) volume was conservatively estimated by applying a factor of 5 to the sum of AM and PM peak hour conditions. The predicted future Latrobe Road traffic noise levels at the residential and park uses proposed nearest to Latrobe Road are summarized in Table 22. Detailed FHWA Model inputs and results are provided in Appendix G.

Table 22
Predicted Future Exterior Latrobe Road Traffic Noise Levels at Proposed Residential Uses[1]

Location[2]	Description	Distance from Roadway Centerline (ft)[3]	Future Exterior DNL (dB)[4]
Park	Village Park	300	61
Park	Neighborhood Park 1	150	62
SFL Lots 588-598	Backyards	95	68
	First-Floor Facades	110	67
	Upper-Floor Facades	110	69
SFL Lots 550-560	Backyards	95	65
	First-Floor Facades	110	64
	Upper-Floor Facades	110	66
SFM Large Lot 2	Backyards	230	60
	First-Floor Facades	60	68
	Upper-Floor Facades	60	70

[1] A complete listing of FHWA Model inputs and results are provided in Appendix G.
[2] Locations of parks and lots are shown in Figure 2.
[3] Distances scaled from effective noise center of proposed parks and residential lots to roadway centerline using provided site plans.
[4] A +2 dB offset was applied to upper-floor facades for reduced ground absorption of sound at elevated locations.

Source: BAC 2023.

As indicated in Table 22, predicted future Latrobe Road traffic noise level exposure at the nearest proposed park uses of the development (Village Park and Neighborhood Park 1) would satisfy the applicable El Dorado County General Plan exterior noise level standard of 70 dB DNL for playgrounds and neighborhood park uses. However, at the nearest single-family low density residential (SFL) backyards, future Latrobe Road traffic noise level exposure is predicted to exceed the General Plan exterior noise level standard of 60 dB DNL for residential uses.

Although the project site plans contain the general location of the proposed single-family medium density residential (SFM) large lot, the locations of the individual residences and outdoor activity areas are currently unknown. However, the Table 22 data indicate that future Latrobe Road exterior traffic noise levels are predicted to be 60 dB DNL at a distance of 230 feet from the centerline of the roadway. Thus, future Latrobe Road traffic noise exposure would exceed the applicable El Dorado County General Plan 60 dB DNL exterior noise level standard should the outdoor activity areas of the residences within the proposed SFM large lot be located within 230 feet from the centerline of Latrobe Road. Based on the analysis provided above, this impact is identified as being **potentially significant**.

Mitigation Impact 10:

To satisfy the El Dorado County General Plan 60 dB DNL exterior noise level standard at the single-family low and medium density residential outdoor activity areas proposed nearest to Latrobe Road, the following noise mitigation measures should be implemented:

MM-10A: To satisfy the General Plan 60 dB DNL exterior noise level standard at the backyards of the single-family residential lots proposed nearest to Latrobe Road, the construction of solid traffic noise barriers ranging from 6 to 9' in height at the locations illustrated in Figure 4 would be required. Appendix H contains the inputs and results from the barrier analysis.

It is recommended that the traffic noise barriers take the form of a masonry wall, earthen berm, or combination of the two. Other materials may be acceptable (i.e., wood or wood composite fence with overlapping slat construction) but should be reviewed by an acoustical consultant prior to construction.

MM-10B: To satisfy the General Plan 60 dB DNL exterior noise level standard at the backyards of the single-family medium density (SFM) lots, one of the following two noise measures could be implemented by the project developer:

1. Ensure that the outdoor activity areas of the residential lots proposed within the SFM area maintain a minimum setback distance of 230 feet from the centerline of Latrobe Road; or
2. Should the outdoor activity areas of the proposed residential lots within the SFM area be proposed within 230 feet from the centerline of Latrobe Road, the construction of solid traffic noise barriers would be required along the property lines of the lots located within that setback distance. Once site plans that include building pad elevations are available, a site-specific noise study would need to be completed by a qualified noise consultant in order to determine the overall final heights of barriers required at those locations.

   It is recommended that the traffic noise barriers take the form of a masonry wall, earthen berm, or combination of the two. Other materials may be acceptable (i.e., wood or wood composite fence with overlapping slat construction) but should be reviewed by an acoustical consultant prior to construction.

Significance of Impact 10 after Mitigation: ***Less than Significant***

Impact 11: Future Interior Traffic Noise Levels at Proposed Residential Uses

Standard residential construction (stucco siding, STC-27 windows, door weather-stripping, exterior wall insulation, composition plywood roof), *typically* results in an exterior to interior noise reduction of approximately 25 dB with windows closed and approximately 15 dB with windows open. Therefore, provided future traffic noise levels do not exceed 70 dB DNL at exterior building facades, standard construction practices should be adequate to ensure compliance with the El Dorado County General Plan 45 dB DNL interior noise level standard at the project site.

After implementation of Mitigation Measure 8A (construction of property line traffic noise barriers), future exterior traffic noise levels from Latrobe Road are predicted to be approximately 60 dB DNL or less at the first-floor facades of the single-family low density (SFL) residences constructed nearest to the roadway. Due to reduced ground absorption at elevated positions and lack of shielding by the noise barriers identified in Mitigation Measure 9A, future Latrobe Road traffic noise levels at the upper-floor facades of those residences are predicted to be as high as 69 dB DNL (Table 22). According to the Table 22 data, future exterior Latrobe Road traffic noise levels at the SFM residences are predicted to be approximately 68 dB DNL at a distance of 60 feet from the roadway centerline. Due to reduced ground absorption at elevated positions, upper-level traffic noise levels from Latrobe Road would approach 70 dB DNL at that same distance.

Based on the information above, standard construction should be adequate to reduce future Latrobe Road traffic noise levels within all floors of SFL residences constructed adjacent to the roadway. However, future traffic noise level exposure is calculated to be only 1 dB below the General Plan 45 dB DNL interior noise level standard.

Predicted future Latrobe Road interior traffic noise levels within the SFM residences constructed at least 60 feet from the roadway centerline would satisfy the 45 dB DNL interior noise level standard (i.e., standard building construction practices with windows closed and mechanical ventilation provided). However, should residences within the SFM large lot be constructed within 60 feet from the centerline of Latrobe Road, future interior traffic noise levels from the roadway could exceed the General Plan 45 dB DNL interior noise level standard at the upper-floors of those residences. As a result, this impact is identified as being **potentially significant**.

Mitigation Impact 11:

To satisfy the El Dorado County General Plan 45 dB DNL interior noise level standard within the single-family low and medium density residences proposed nearest to Latrobe Road (*including* a factor of safety), the following noise mitigation measures should be implemented:

MM-11A: To achieve a greater margin of safety, the window construction upgrades identified in Figure 5 should be integrated into the project design. Specifically, the upper-floor bedrooms windows of the lots identified in Figure 5 from which Latrobe Road would be visible should be upgraded to have a minimum Sound Transmission Rating (STC) of 32. In addition, mechanical ventilation (air conditioning) should be provided for all residences within this development to allow the occupants to close doors and windows to achieve compliance with General Plan 45 dB DNL interior noise level standard.

MM-11B: Should the building facades of residences located within the SFM large lot be proposed within 60 feet from the centerline of Latrobe Road, all upper-floor bedroom windows of the residences located within that setback distance that would have a view of the roadway should be upgraded to a minimum STC of 32.

Significance of Impact 11 after Mitigation: ***Less than Significant***

Impact 12: Park Activity Noise Levels at Proposed Residential Uses

According to the project site plan shown in Figure 2, parks are proposed to be located adjacent to residential uses within the development. Park activities have been identified as a primary noise source that could impact nearby residential uses proposed within the development.

An analysis of park activity noise exposure at existing noise-sensitive (residential) uses was presented in **Impact 4**. BAC file data referenced in that analysis indicate that parks consisting of active uses have noise levels of up to 60 dB L_{eq} and 70 dB L_{max} at a distance of 50 feet.

Section 130.37.020 of the El Dorado County Municipal Code provides an exemption for noise from activities conducted in parks, such as those proposed by the project. However, project park noise levels would be subject to compliance with applicable El Dorado County General Plan noise level limits. Park activities would likely consist of human speech (i.e., shouting and cheering during activities), which would be subject to the General Plan's more restrictive daytime, evening, and nighttime noise level standards for community regions shown in Table 7. However, it is reasonable to assume that park hours would be likely be restricted to daytime and evening hours only (7:00 a.m. to 10:00 p.m.). Satisfaction with the General Plan's more restrictive evening noise level standards would ensure for compliance with the General Plan's less restrictive daytime noise level limits. Therefore, project park noise exposure at the nearest proposed residential uses was assessed relative to the applicable General Plan evening noise level standards for community regions shown in Table 7.

The nearest proposed residential uses to a park within the development maintain a separation of approximately 150 feet from the center of the park (Neighborhood Park 2). Based on the reference noise levels presented above, and assuming standard spherical spreading loss (-6 dB per doubling of distance), park activity noise levels at the nearest proposed residential uses located 150 feet away is calculated to be 50 dB L_{eq} and 60 dB L_{max}. The predicted park activity noise levels of 50 dB L_{eq} and 60 dB L_{max} at the nearest residential uses would exceed the applicable El Dorado General Plan evening noise level standards of 45 dB L_{eq} and 55 dB L_{max}. As a result, this impact is identified as being **potentially significant**.

Mitigation Impact 12:

To reduce the potential for an exceedance of the applicable El Dorado County General Plan evening noise level standards at proposed residential uses, the following park noise mitigation measure should be implemented:

MM-12: Solid noise barriers measuring a minimum of 6-feet in height (relative to backyard elevation) should be constructed at the locations illustrated in Figure 6. The recommended noise barrier extension could take the form of a solid masonry wall or wood fence. Should the construction of a wood fence be selected as a barrier, the fence slats should overlap by a minimum of two inches and be screwed to the framing rather than nailed. The purpose of the overlapping slats and using screws rather than nails is to ensure that prolonged exposure to the elements does not result in visible gaps through the slats which would result in reduced noise barrier

effectiveness. The final barrier design should be reviewed by an acoustical consultant prior to installation.

The construction of 6-foot-tall noise barriers at the locations illustrated in Figure 6 would break line of sight of the park activities at the outdoor activity areas of the nearest proposed residences. This shielding is estimated to provide approximately 5 dB of noise attenuation, which would reduce predicted park noise level levels to 45 dB L_{eq} and 55 dB L_{max} or less at those locations and would satisfy the applicable El Dorado County General Plan 45 dB L_{eq} and 55 dB L_{max} evening noise level noise level standards.

Significance of Impact 12 after Mitigation: ***Less than Significant***

Impact 13: Existing El Dorado Business Park Operations Noise Levels at Proposed Residential Uses

As indicated in Figure 1, existing commercial / office uses (El Dorado Business Park) are located north of the proposed development. Primary noise sources associated with the adjacent commercial uses have been identified as mechanical equipment (HVAC), parking lot movements, and truck loading dock activities. According to BAC ambient noise level data collected at the project site (Appendices D & E), not including natural sounds (i.e., frogs, crickets, etc.), noise from the existing commercial operations to the north did not exceed the County's noise standards applicable to stationary noise sources. As a result, this impact is considered to be ***less than significant*.**

This concludes BAC's noise and vibration assessment of the Creekside Village Residential Development project in El Dorado County, California. Please contact BAC at (530) 537-2328 or dariog@bacnoise.com if you have any comments or questions regarding this report.

Appendix A
Acoustical Terminology

Acoustics The science of sound.

Ambient Noise The distinctive acoustical characteristics of a given space consisting of all noise sources audible at that location. In many cases, the term ambient is used to describe an existing or pre-project condition such as the setting in an environmental noise study.

Attenuation The reduction of an acoustic signal.

A-Weighting A frequency-response adjustment of a sound level meter that conditions the output signal to approximate human response.

Decibel or dB Fundamental unit of sound. A Bell is defined as the logarithm of the ratio of the sound pressure squared over the reference pressure squared. A Decibel is one-tenth of a Bell.

CNEL Community Noise Equivalent Level. Defined as the 24-hour average noise level with noise occurring during evening hours (7 - 10 p.m.) weighted by a factor of three and nighttime hours weighted by a factor of 10 prior to averaging.

Frequency The measure of the rapidity of alterations of a periodic signal, expressed in cycles per second or hertz.

IIC Impact Insulation Class (IIC): A single-number representation of a floor/ceiling partition's impact generated noise insulation performance. The field-measured version of this number is the FIIC.

L_{dn} Day/Night Average Sound Level. Similar to CNEL but with no evening weighting.

L_{eq} Equivalent or energy-averaged sound level.

L_{max} The highest root-mean-square (RMS) sound level measured over a given period of time.

Loudness A subjective term for the sensation of the magnitude of sound.

Masking The amount (or the process) by which the threshold of audibility is for one sound is raised by the presence of another (masking) sound.

Noise Unwanted sound.

Peak Noise The level corresponding to the highest (not RMS) sound pressure measured over a given period of time. This term is often confused with the "Maximum" level, which is the highest RMS level.

RT_{60} The time it takes reverberant sound to decay by 60 dB once the source has been removed.

STC Sound Transmission Class (STC): A single-number representation of a partition's noise insulation performance. This number is based on laboratory-measured, 16-band (1/3-octave) transmission loss (TL) data of the subject partition. The field-measured version of this number is the FSTC.

Appendix G-1
FHWA Traffic Noise Prediction Model (FHWA-RD-77-108)
Noise Prediction Worksheet

Project Information:

Job Number: 2020-143
Project Name: Creekside Village Residential Development
Roadway Name: Latrobe Road

Traffic Data:

Year: Future (2040)
Average Daily Traffic Volume: 17,480
Percent Daytime Traffic: 83
Percent Nighttime Traffic: 17
Percent Medium Trucks (2 axle): 2
Percent Heavy Trucks (3+ axle): 1
Assumed Vehicle Speed (mph): 55
Intervening Ground Type (hard/soft): **Soft**

Traffic Noise Levels:

				---------- DNL, dB ----------			
Location	**Description**	**Distance**	**Offset (dB)**	**Autos**	**Medium Trucks**	**Heavy Trucks**	**Total**
Park	Village Park	300		60	50	51	61
SFL Lots 588-598	Nearest Backyards	95		67	57	58	68
	Nearest First-Floor Facades	110		66	56	57	67
	Nearest Upper-Floor Facades	110	2	68	58	59	69

Traffic Noise Contours (No Calibration Offset):

DNL Contour (dB)	Distance from Centerline (ft)
75	32
70	70
65	150
60	324

Notes: 1. Future (Cumulative 2040 Plus Project conditions) average daily traffic volume for Latrobe Road was calculated using data provided in the traffic impact study conducted for the project by T. Kear Transporation Planning & Management, Inc.
2. Offset of +2 dB offset was applied at upper-level building facades to account for reduced ground absorption of sound at elevated positions.

Reduced Impact Alternative Memorandum (December 2024)

Memorandum

To: Tony Gon
Winn Communities
555 University Avenue, Suite 180
Sacramento, CA 95825

Date: December 10, 2024

From: Dario Gotchet, Principal
Bollard Acoustical Consultants, Inc.
P.O. Box 7968
Auburn, CA 95604

Subject: Creekside Village Development – Revised Tentative Map Plan & Trip Generation Information for the Reduced Impact Alternative

Dear Tony,

Bollard Acoustical Consultants, Inc. (BAC) previously completed an environmental noise assessment for the Creekside Village Development (latest revision dated February 21, 2024). It was brought to the attention of BAC in October 2024 that revisions were made to the project tentative map plan and traffic impact analysis. Further, BAC was informed that a Reduced Impact Alternative is now being proposed. In response to those changes, BAC has prepared this memorandum. Specifically, this memorandum includes the revised tentative map plan with associated mitigation as identified in the noise assessment previously prepared by BAC in 2024. This memorandum also contains a discussion on the potential impacts associated with the revised project trip generation information.

It should be noted that the function of this memorandum is to supplement the noise assessment previously prepared by BAC in February 2024. For the purposes of this memorandum, that assessment will be referenced as the 2024 BAC Noise Study.

Revised Project Tentative Map Plan – Reduced Impact Alternative

The analysis, results and impact determinations contained in the 2024 BAC Noise Study are based on the project site plan identified in Figures 2, 4, 5 and 6. Figures 4 through 6 of the 2024 BAC Noise Study contain illustrations of required mitigation measures as outlined in the report. As mentioned above, it has been brought the attention of BAC that a tentative map plan has been revised, included as a Reduced Impact Alternative to the EIR. Figures 2, 4, 5 and 6 of 2024 BAC Noise Study have been revised to include the new tentative map plan (Reduced Impact Alternative) and are presented in this memorandum as Attachments A, B, C and D. Attachments B through D of this memorandum include integration of the mitigation measures as outlined in the 2024 BAC Noise Study. It should be noted that, although the revised site design under the Reduced Impact Alternative did not warrant revisions to mitigation language as presented in the 2024 BAC Noise Study, the revised site design did

trigger minor changes to the illustrated mitigation measures in those graphics (i.e., extending lengths of sound walls).

Revised Trip Generation – Reduced Impact Alternative

The analysis, results and impact determinations contained in the 2024 BAC Noise Study are based on trip generation estimates prepared by T. Kear Transportation Planning & Management (dated August 24, 2023). That 2022 trip generation information indicates a total of 10,040 new project trips, which accounted for residential and commercial land uses of the development. As mentioned above, it has been brought the attention of BAC that trip generation estimates have revised, included as a Reduced Impact Alternative to the EIR. According to revised (2024) trip generation information (prepared by T. Kear), a total of 4,147 new trips are calculated under the Reduced Impact Alternative – which is calculated to be approximately 59% less total trips than previously reported by T. Kear. As indicated in the 2024 BAC Noise Study, noise impacts associated with project-generated increases in off-site traffic are determined to be less than significant (Impacts 2 and 3). Based on the revised trip generation estimate (4,147) and considering that that revised estimate is significantly lower than that previously reported (10,040), the impact determinations associated with the revised trip generation information for the Reduced Impact Alternative would not change from presented in the 2024 BAC Noise Study. Further, traffic noise levels associated with the revised trip generation estimate are expected to be lower than those levels report in the 2024 BAC Noise Study.

Conclusions

This concludes our review of the revised tentative map and trip generation information for the Creekside Village development. Please contact me at (530) 537-2328 or dariog@bacnoise.com if you have any questions or require additional information.

Sincerely,

Bollard Acoustical Consultants, Inc.

REVISION HISTORY

Description	Date	Notes
Internal Draft	February 19, 2024	Draft TIS.
Admin Draft	February 22, 2024	Revisions for clarity.
Public Report	April 25, 2024	Added EBL queue data at intersection 3, clarified abatement 18A.

EXECUTIVE SUMMARY

This transportation impact study (TIS) analyzes the proposed Creekside Village Specific Plan (the Project) for consistency with the El Dorado County General Plan level-of-service policies and for vehicle miles of travel (VMT) impacts under the California Environmental Quality Act (CEQA). Where appropriate, abatement measures are provided to address any deficiencies relative to adopted General Plan policies and mitigation measures are provided to address any potentially significant impacts under CEQA.

Creekside Village (the Project) is a planned community with housing, parks, open space, and neighborhood commercial located in the El Dorado Hills community region of El Dorado County. Requested entitlements include a tentative subdivision map allowing for up to 918 single family homes and an option to include up to 5,400 sqft of neighborhood commercial, a General Plan amendment, and a new Specific Plan. The Project proposes 668 residential lots, and two large lots for the remaining 250 single family homes on a vacant 207.9 acre parcel located on the southern end of the El Dorado Hills Business Park, south of Investment Boulevard and west of Latrobe Road. The Project parcels are APNs 117-010-032 and a portion of 117-010-031. A vicinity map Is shown in **Figure ES-1**. The Project parcel is split by a creek, with most of the housing located on the south side of the creek. The north side of the creek would contain 87 of the residential lots, neighborhood commercial, parks and open space, and the south side of the creek would include 581 of the residential lots plus two large lots for the remaining 250 dwelling units, parks, and open space.

The Project parcel has been de-annexed from the business park, and the applicant is requesting to change its General Plan land use designation and zoning from Research and Development (R&D) to Adopted Plan (AP) with Single Family Low Density (CV-SFL), Single Family Medium Density (CV-SFM) residential, and Neighborhood Commercial (CV-NC), Open Space (CV-OS) and Parks (CV-P) land use designations within the plan area.

Project Description

Figure ES-2 provides a preliminary site plan for the Project. The Project would:

- Amend the General Plan, change the zoning designation, and adopt a specific plan to allow the development of 207.9 acres for residential, neighborhood commercial and related uses on land that is undeveloped and currently designated as industrial and R&D.

Figure ES-1. Project location map

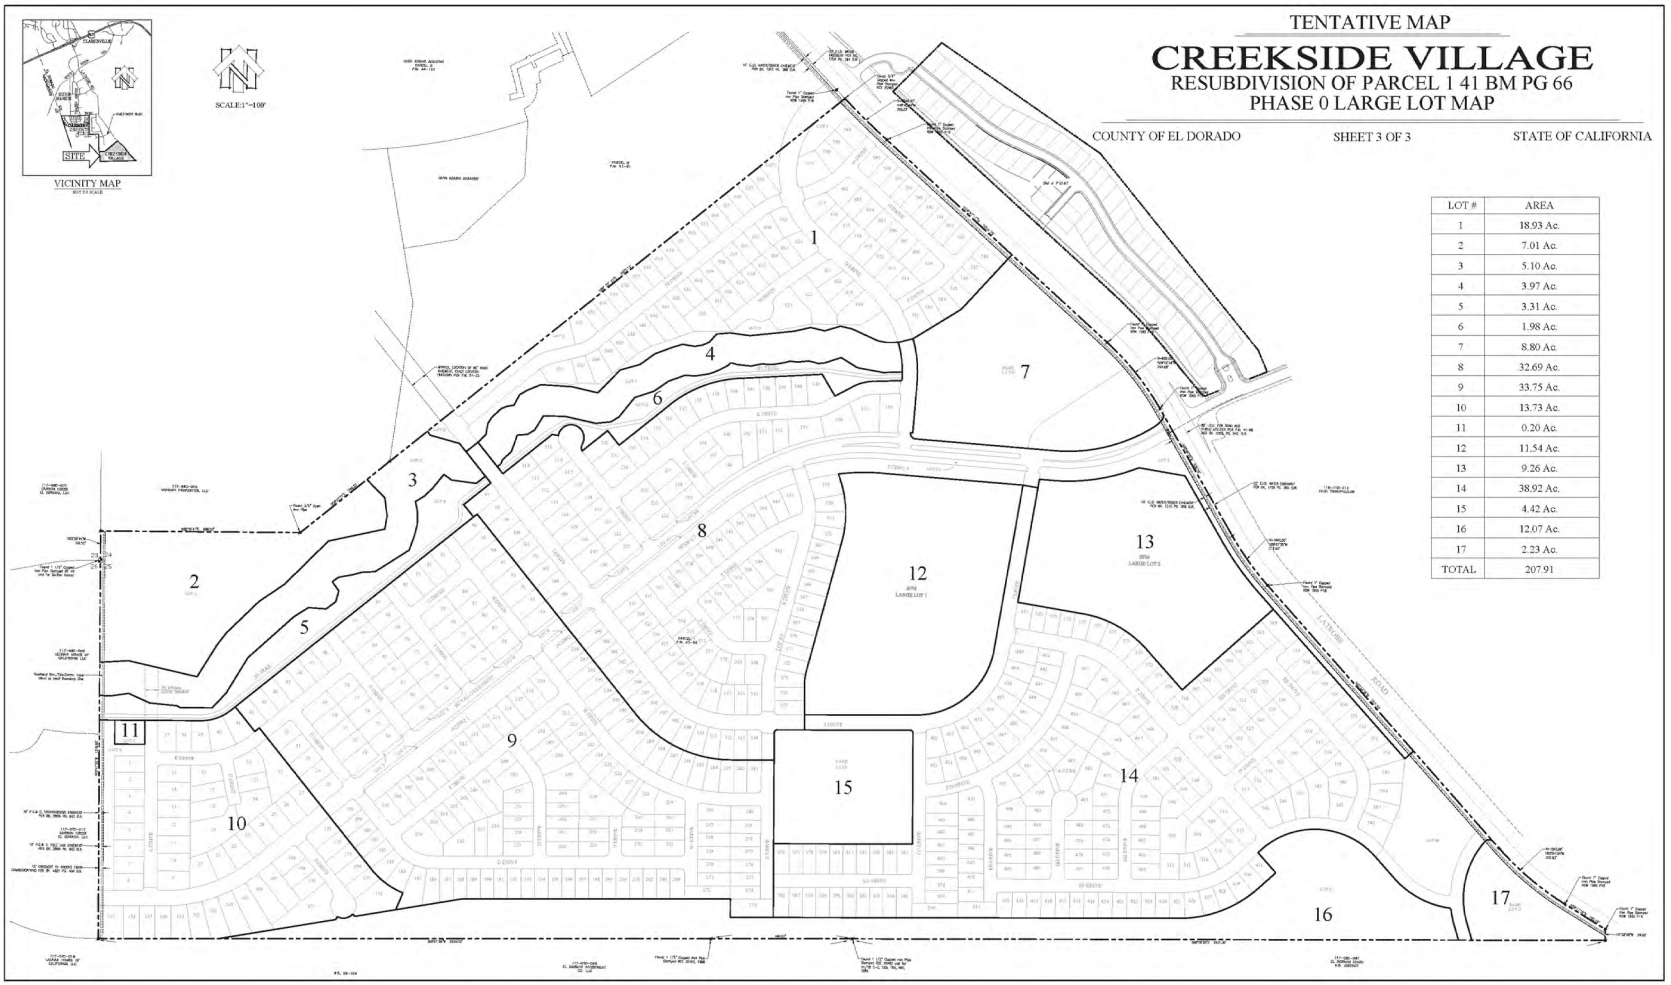

Figure ES-2. Preliminary Project site plan

- Create a Tentative Map for 668 homesites, 2 large-lot parcels that are analyzed as a combined total of 250 additional homes and 5,400 sqft of neighborhood commercial (918 homes and 5,400 sqft of commercial in total). The Tentative Map would include additional lots associated with parks and open space and various landscape lots.

Access to the Project will be provided by three roadways, a commercial driveway and a multiuse trail:

- The primary access will be from Latrobe Road via an extension of Royal Oaks Drive. The intersection of Latrobe Rd/Royal Oaks Dr is proposed to remain as full access, This intersection is analyzed with its existing two-way-stop-control, with signal-controlled recommended as an abatement to maintain acceptable level-of-service.
- The first secondary access road is an extension of Avanti Dr. The intersection is proposed as full access with side-street-stop-control.
- The second secondary access is via a connection to Wetsel-Oviatt Road.
- A right-in/right-out (RIRO) commercial driveway is proposed providing the neighborhood commercial site with direct access to southbound Latrobe Rd. The commercial driveway would be located just north of the existing Latrobe Rd/Royal Oaks Dr intersection.
- A pedestrian and bicycle access route connecting to Robert J. Mathews Parkway will provide enhanced non-motorized access to the medical, education, fitness, service, food, and retail options within the El Dorado Hills Business Park.

Traffic is distributed across the driveways based on the rough proximity of each land use to the access points.

Study Area

The TIS area (**Figure ES-3**), which includes portions of White Rock Road, Latrobe Road, El Dorado Hills Boulevard, Silva Valley Parkway and US 50 in El Dorado County, California, was selected with consideration of the requirements of CEQA and General Plan policies TC-Xd and TC-Xe. Specifically, the study was selected to include El Dorado County locations where Project traffic would constitute:

A. A two percent increase in traffic during the AM peak hour, PM peak hour, or daily; or,
B. The addition of 100 or more daily trips; or,
C. The addition of 10 or more trips during the AM peak hour or the PM peak hour.

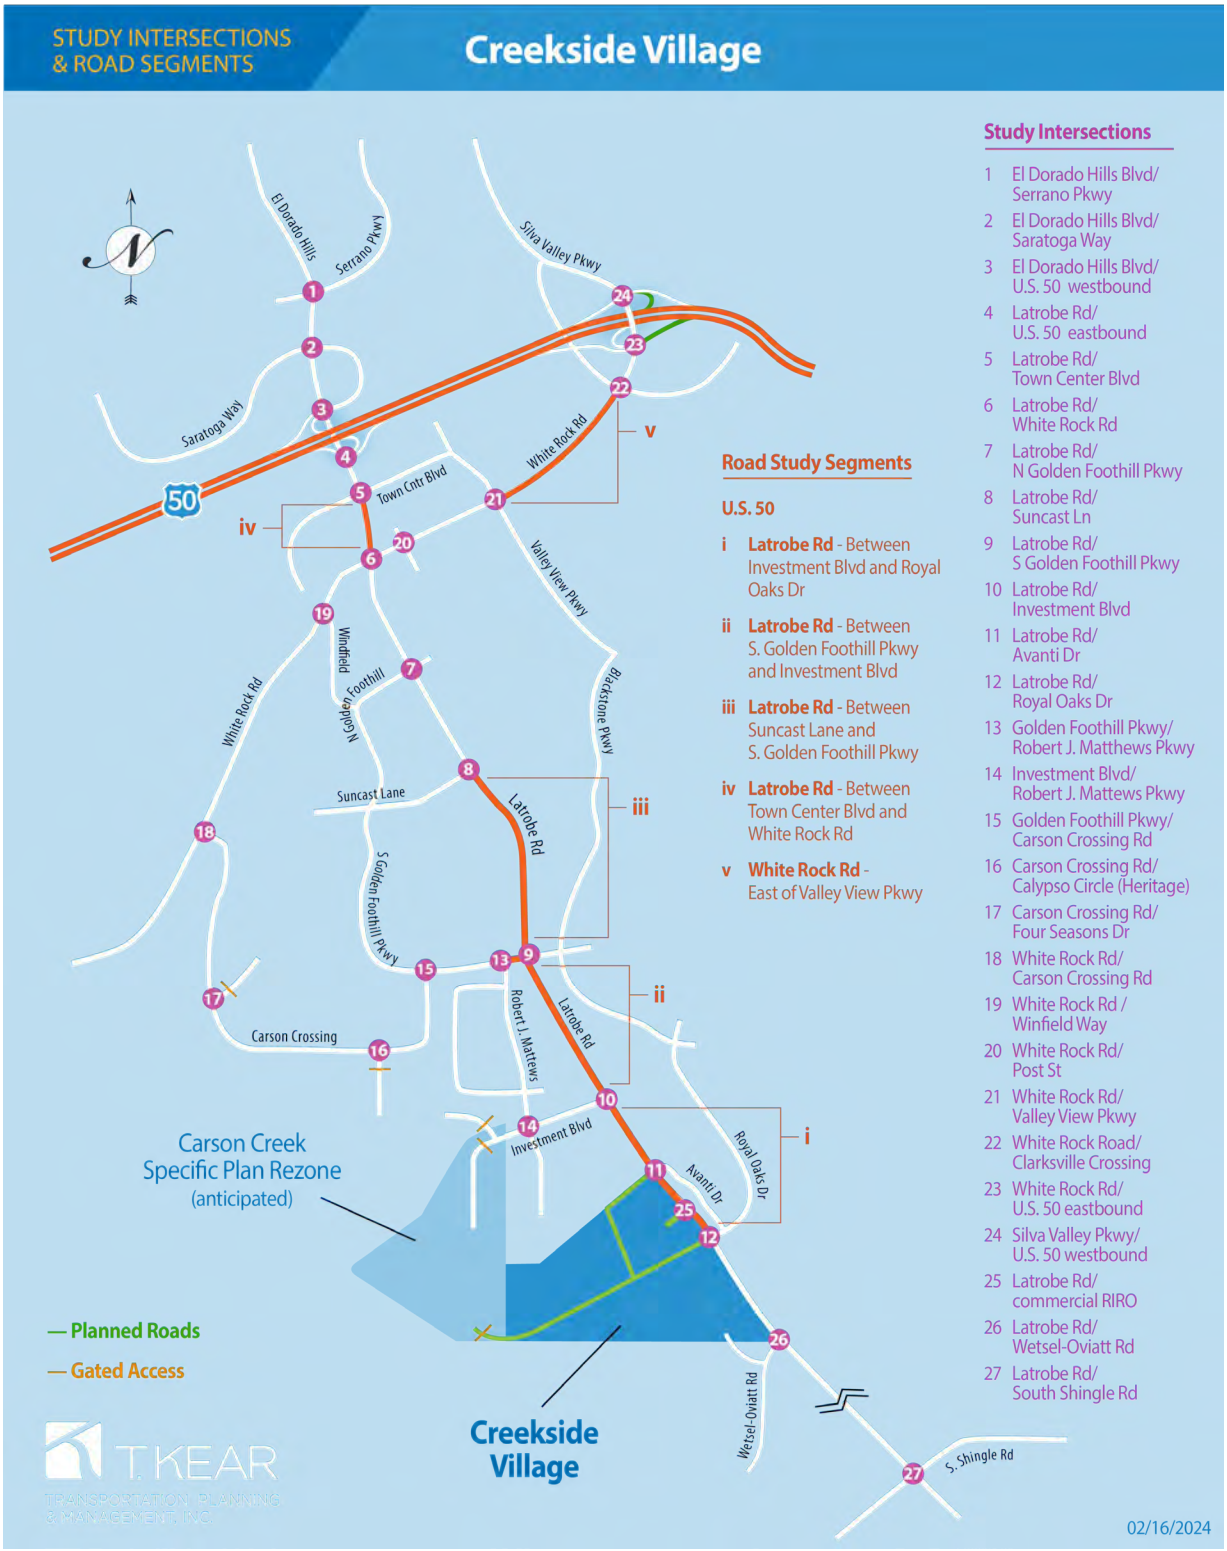

Figure ES-3 Study area

Project Trip Generation and Distribution

Anticipated Traffic generation by the Project reflects both trips generated by the Project itself, and, avoided trips in 2033 and 2040 from the commercial land uses that the El Dorado County TDM assumes will take place on the Project parcels.

Project Trips

Anticipated trips are based on Institute of Transportation Engineers (ITE) Trip Generation Manual, 11th Edition (2021). **Table ES-1** shows anticipated Project Trip Generation. To be conservative, trip generation estimates are generally based on the higher rates for the peak hour of the generator rather than the peak hour of adjacent street traffic. The higher of either the average trip generation rate or equation-based trip generation rate was also used.

Avoided Trips

Avoided trips are additional peak hour trips that the TDM assumes in the future from growth within the Project TAZ. These avoided trips were estimated by running the TDM with and without assumed 2020[1] through 2040 employment growth for the effected portion of the Project's transportation analysis zone (TAZ 612). Creekside Village replaces 62% of the available land in TAZ 612 (**Figure ES-4**), therefor 62% of the employment growth was eliminated from TAZ 612 when estimating the number of avoided trips using the TDM. TDM employment assumptions for TAZ 612 are shown in **Table ES-2** below, along with the resulting avoided trips.

Trip Distribution with Adjustment for Latrobe Elementary

Project trip distribution was based on the El Dorado County TDM, observed counts, prior studies in the vicinity of the Project, and consultation with El Dorado County staff. Additional adjustments were made to reflect school trips to Latrobe Elementary based on student generation statistics published by the school district. Trip distribution is shown in **Figure ES-5**.

[1] 2020 is used rather than 2023 because the process of purchasing the land and de-annexing it from the business park meant that no new employment on this portion of the model TAZ occurred as of that year.

Table ES-1. 918 Single-family dwelling units trip generation

Land Use	Quantity	Metric	Daily	AM Peak Hour			PM Peak Hour

FINDINGS

Trip Generation Findings

The 918 dwelling unit Project with 5,400 sqft of neighborhood commercial space is anticipated to generate 834 AM peak hour trips, 955 PM peak hour trips, and 10,040 daily trips. Those trips are largely offset by 2040 through forgone commercial development on the 207.9 ac project site which the travel demand model anticipated would have generated 733 AM peak hour trips, 829 PM peak hour trips, and 9,415 daily trips. Net, the Project therefore adds only 101 AM peak hour trips during the AM peak hour, 126 trips during the PM peak hour, and 625 daily trips over what was assumed in travel demand model horizon year. Trip Generation is discussed in more detail in **Section 5.1**.

CEQA Findings

VMT: The 918 dwelling unit residential component of the Project is anticipated to have home based VMT per capita of 13.6 in 2023 and 13.1 in 2040, compared to a significance threshold (calculated using the same methodology and data as the Project impacts) of 17.3. Therefore the residential component of the Project has a **less-than significant** impact on VMT. The 5,400 sqft neighborhood commercial local serving retail component of the Project offers improved destination choices for local residents and can be assumed to have a **less-than significant** impact on VMT. The VMT analysis is discussed in **Section 3.4** and **Section 11**.

Transit: The Project does not interfere with existing or proposed transit service and has a **less-than-significant** impact on transit. Transit impacts are briefly discussed in **Section 12**.

Bicycles and Pedestrians: The Project enhances bicycle and pedestrian access to the El Dorado Hills Business Park and does not interfere with existing or planned bicycle and pedestrian facilities. The Project includes a variety of bike and pedestrian amenities providing connections both within the planned community and externally to the existing bike and pedestrian facilities along Latrobe Road and Royal Oaks Dr. Therefore, the Project has a **less-than-significant** impact on bicycle and pedestrian facilities. Bicycles and pedestrian impacts are briefly discussed in **Section 12**.

General Plan Level-of-Service and Queue Length Findings

Deficiencies that are caused or worsened by the Project, and abatement measures to address said deficiencies, are identified for existing 2023 plus Project, Existing Plus Approved Projects (EPAP) 2033 plus Project, and cumulative 2040 plus Project conditions.

Throughout this document, segment deficiencies are numbered using the segment number (i through v) and a year code (2023 = “A”, 2033 = “B”, and 2040 = “C”). Intersection abatement measures are numbered using the intersection number (1-27) and the year code (A, B, or C). Locations with project causes new or worsen existing deficiencies are listed in **Table ES-2**. The first occurrence of an abatement measure is listed in **bold red** font, subsequent applications of an abatement measure are listed in a regular typeface. Abatement measures for existing 2023 plus Project conditions are described in more detail in **Section 6.3**, EPAP 2033 plus Project conditions in **Section 8.3**, and Cumulative 2040 plus Project in **Section 10.3**.

1.0 INTRODUCTION AND BACKGROUND

This transportation impact study (TIS) analyzes the proposed Creekside Village Specific Plan (the Project) for consistency with the El Dorado County General Plan level-of-service policies and for vehicle miles of travel (VMT) impacts under the California Environmental Quality Act (CEQA). Where appropriate, abatement measures are provided to address any deficiencies relative to adopted General Plan policies and mitigation measures are provided to address any potentially significant impacts under CEQA.

Creekside Village (the Project) is a planned community with housing, parks, open space, and neighborhood commercial located in the El Dorado Hills community region of El Dorado County. Requested entitlements include a tentative subdivision map allowing for up to 918 single family homes and 5,400 sqft of neighborhood commercial, a General Plan amendment, and a new Specific Plan. The Project proposes 668 residential lots, and two large lots for the remaining 250 single family homes on a vacant 207.9 acre parcel located on the southern end of the El Dorado Hills Business Park, south of Investment Boulevard and west of Latrobe Road. The Project parcels are APNs 117-010-032 and a portion of 117-010-031. A vicinity map is shown in **Figure 1**. The Project parcel is split by a creek, with most of the housing located on the south side of the creek. The north side of the creek would contain 87 of the residential lots and open space, and the south side of the creek would include 581 of the residential lots plus two large lots for the remaining 250 dwelling units.

The Project parcel has been de-annexed from the business park, and the applicant is requesting to change its General Plan land use designation and zoning from Research and Development (R&D) to Adopted Plan (AP) with Single Family Low Density (CV-SFL), Single Family Medium Density (CV-SFM) residential, and Neighborhood Commercial (CV-NC), Open Space (CV-OS) and Parks (CV-P) land use designations within the plan area.

Project Description

Figure 2 provides a preliminary site plan for the Project. The Project would:

- Amend the General Plan, change the zoning designation, and adopt a specific plan to allow the development of 207.9 acres for residential, neighborhood commercial and related uses on land that is undeveloped and currently designated as industrial and R&D.
- Create a Tentative Map for 668 homesites, 2 large-lot parcels that are analyzed as a combined total of 250 additional homes and 5,400 sqft of neighborhood commercial (918 homes and 5,400 sqft of commercial in total). The Tentative Map would include additional lots associated with parks and open space and various landscape lots.

Access to the Project will be provided by three roadways, a commercial driveway and a multiuse trail:

- The primary access will be from Latrobe Road via an extension of Royal Oaks Drive. The intersection of Latrobe Rd/Royal Oaks Dr is proposed to remain as full access, This intersection is analyzed with its existing two-way-stop-control, with signal-controlled recommended as an abatement to maintain acceptable level-of-service.

Figure 1. Project location map

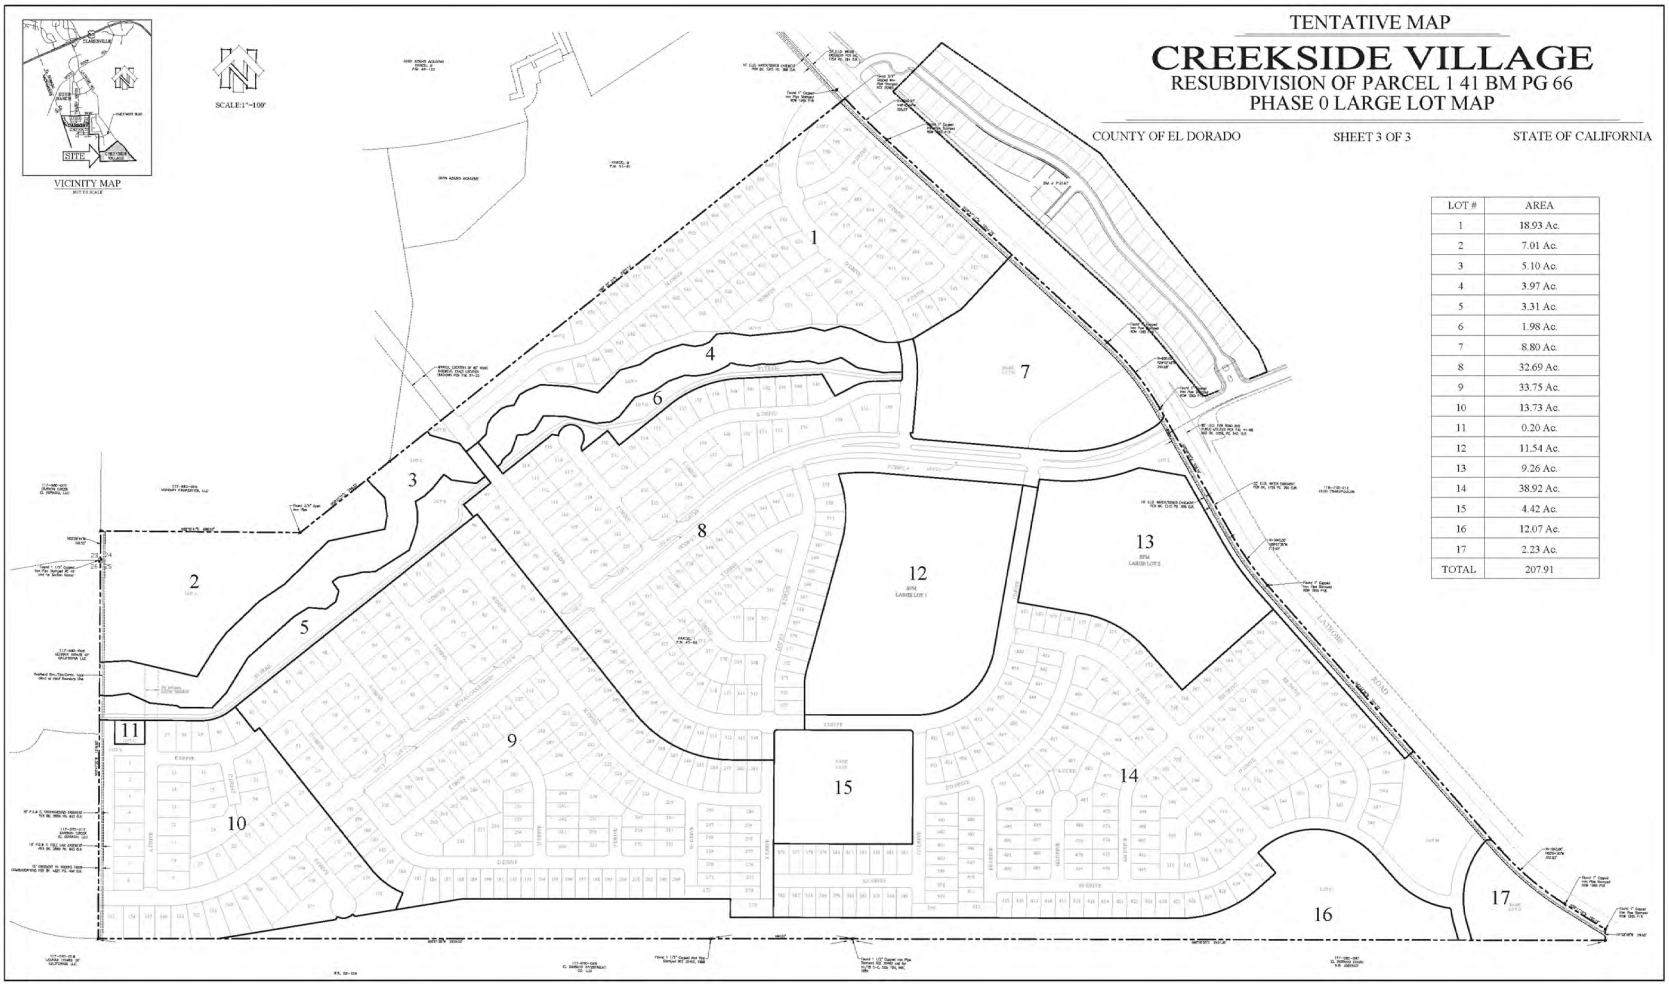

Figure 2. Preliminary Project site plan

- The first secondary access road is an extension of Avanti Dr. The intersection is proposed as full access with side-street-stop-control.
- The second secondary access is via a connection to Wetsel-Oviatt Road.
- A right-in/right-out (RIRO) commercial driveway is proposed providing the neighborhood commercial site with direct access to southbound Latrobe Rd. The commercial driveway would be located just north of the existing Latrobe Rd/Royal Oaks Dr intersection.
- A pedestrian and bicycle access route connecting to Robert J. Mathews Parkway will provide enhanced non-motorized access to the medical, education, fitness, service, food, and retail options within the El Dorado Hills Business Park.

Traffic is distributed across the driveways based on the rough proximity of each land use to the access points.

General Plan Consistency Considerations for Cumulative Impact Analysis

Projects that are consistent with the General Plan, and cumulative travel demand model assumptions, may rely upon the General Plan EIR's cumulative analysis. The Project parcel is currently designated as industrial and R&D in the General Plan and zoned accordingly. The Project requires a general plan amendment and rezoning to accommodate the proposed residential uses and is therefore not consistent with the General Plan or its related CEQA documents. Project-level cumulative analysis is included in this TIS.

2.0 STUDY AREA

The TIS area (**Figure 3**), which includes portions of White Rock Road, Latrobe Road, El Dorado Hills Boulevard, Silva Valley Parkway and US 50 in El Dorado County, California, was selected with consideration of the requirements of CEQA and General Plan policies TC-Xd and TC-Xe. Specifically, the study was selected to include El Dorado County locations where Project traffic would constitute:

D. A two percent increase in traffic during the AM peak hour, PM peak hour, or daily; or,
E. The addition of 100 or more daily trips; or,
F. The addition of 10 or more trips during the AM peak hour or the PM peak hour.

2.1 Project Area Roadways

The following are descriptions of the primary roadways in the project vicinity.

- **El Dorado Hills Boulevard** is a north-south arterial roadway that extends from Green Valley Road on the north to US 50 on the south where it continues as Latrobe Road. North of Green Valley Road it continues as Salmon Falls Road. Between US 50 and Saratoga Way El Dorado Hills Boulevard is a six-lane urban arterial, between Saratoga Way and Serrano Parkway it is a five-lane urban arterial, north of Serrano Parkway it continues as a four-lane urban arterial until Governor Drive, and then as a two-lane urban arterial northward to Green Valley Road. Just north of US 50, El Dorado Hills Boulevard carries approximately 28,000 vehicles per day.

- **Latrobe Road** is a north-south arterial roadway that provides a primary connection to US-50 for western El Dorado County. It extends from US 50, where it continues as El Dorado Hills Boulevard, to State Route 16. It is a six-lane urban arterial road between US 50 and White Rock Road. Latrobe Road is a four-lane urban arterial road between White Rock Road and Golden Foothill Parkway (south). It is a two-lane urban road from Golden Foothill Parkway (south) to Investment Boulevard and a two-lane rural road south of Investment Boulevard. North of White Rock Road, Latrobe Road carries approximately 32,500 vehicles per day with three through travel lanes in each direction. South of US 50, El Dorado Hills Boulevard becomes Latrobe Road.

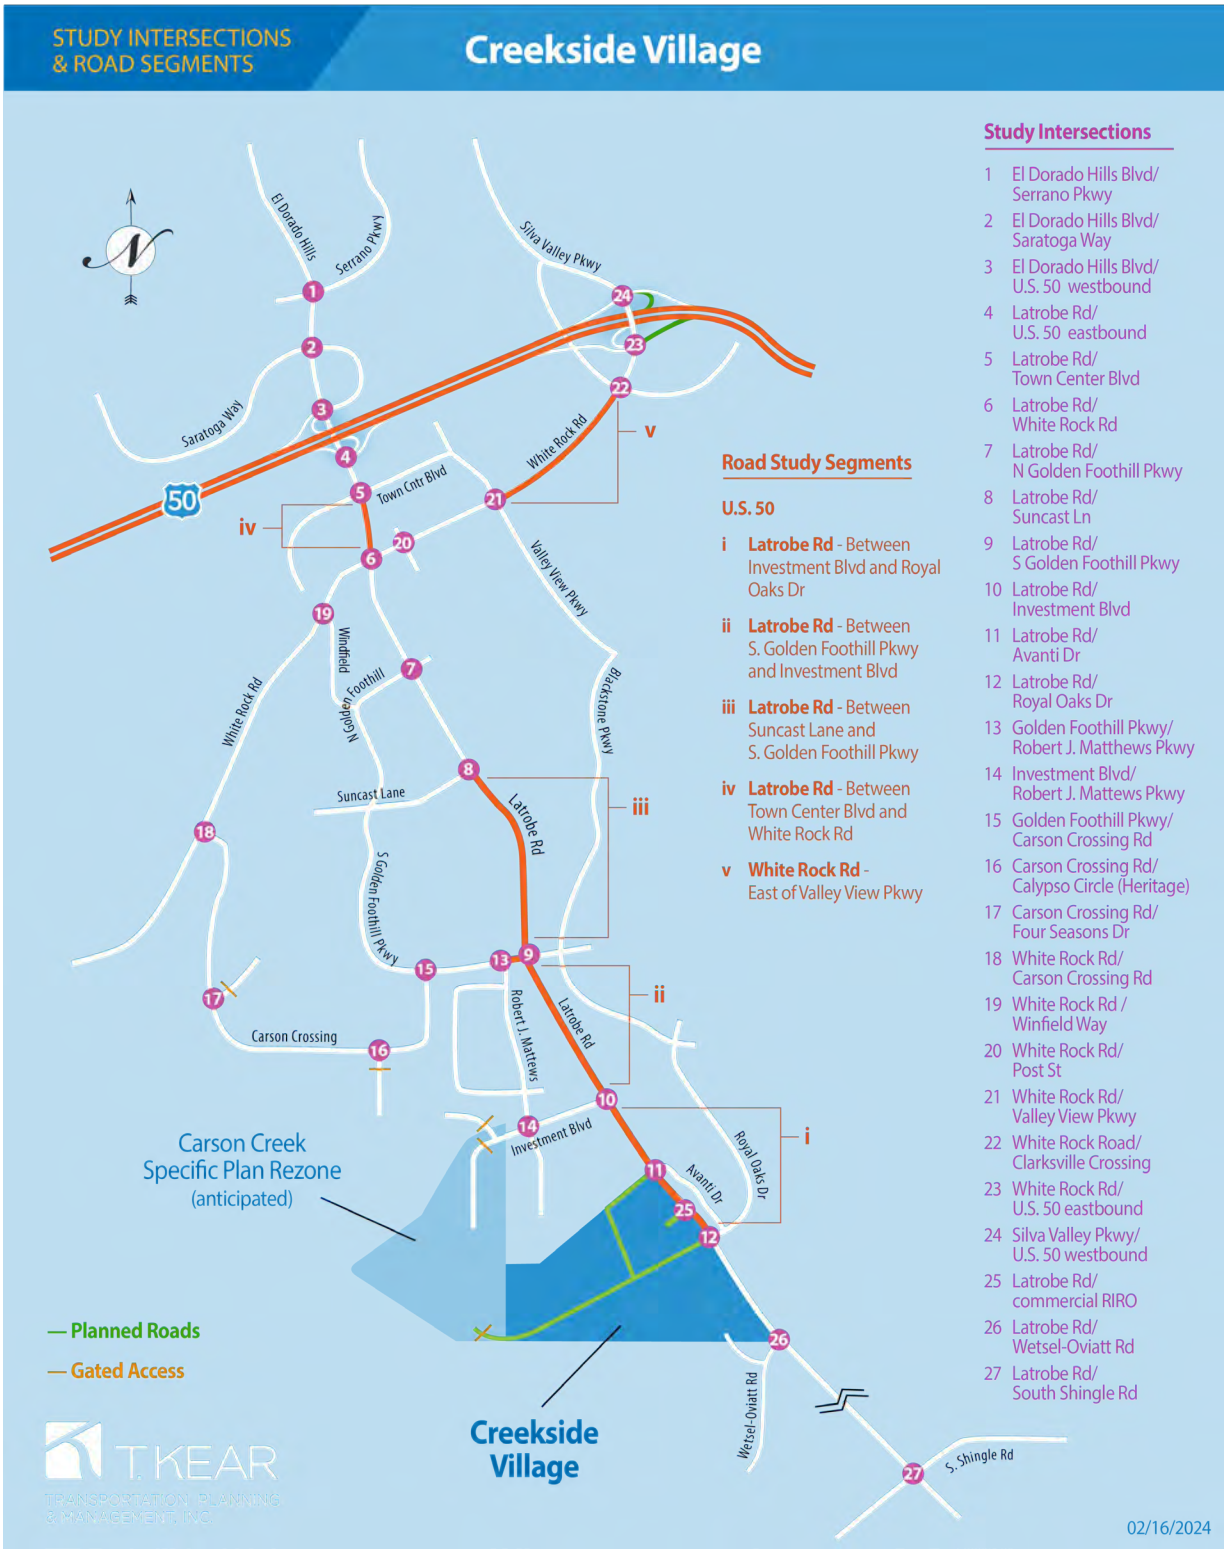

Figure 3. Study area

- **Park Drive** is a two-lane local roadway serving the shopping center located north of US 50 at the El Dorado Hills Boulevard interchange. Park Drive intersects El Dorado Hills Boulevard at two locations, opposite the reconstructed US 50 westbound ramps and then approximately 1000 feet to the north where Saratoga Way intersects El Dorado Hills Boulevard. Park Drive serves about 12,000 vehicles per day east of El Dorado Hills Boulevard.

- **Silva Valley Parkway** is a north-south roadway that generally runs parallel to El Dorado Hills Boulevard north of US 50. The General Plan identifies Silva Valley Parkway as a four-lane divided road. A new US 50 interchange at Silva Valley/White Rock Road opened in 2016, which provides a realigned Silva Valley Parkway that connects to the existing four-lane Silva Valley Parkway to the north and the existing two-lane White Rock Road on the south. The new interchange is located east of the existing underpass, which will be preserved for bike and pedestrian access. Silva Valley Parkway serves about 17,000 vehicles per day north of US 50.

- **White Rock Road** is an east-west arterial that extends through several jurisdictions from Silva Valley Parkway in El Dorado County to International Drive in Rancho Cordova. Within El Dorado County, it is a two-lane urban arterial road from the Sacramento County – El Dorado County line to Manchester Drive, a four-lane urban arterial between Manchester Drive and Post Street, and a two-lane urban arterial road between Post Street and Silva Valley Parkway. White Rock Road carries approximately 8,000 vehicles per day at the Sacramento County – El Dorado County Line and 17,000 vehicles per day just west (south) of the Silva Valley Parkway Interchange.

- **Investment Boulevard:** Is a two-lane local road, running east-west within the El Dorado Hills Business Park. It connects the eastern edge of the CCSP to Robert J. Mathews Parkway and Latrobe Road. Curb and gutter are provided. There are no bike lanes or sidewalks. Twenty-five-foot Lane widths are provided within the business park.

- **Robert J Mathews Parkway:** Is a two-lane local road, running north-south within the El Dorado Hills Business Park. It connects Investment Boulevard to Golden Foothill Parkway on the north. Curb and gutter are provided. There are no bike lanes or sidewalks. Twenty-five-foot Lane widths are provided within the business park. The Project includes an access connecting to Robert J. Mathews Parkway, to encourage residents to walk and bike to the plethora of schools, gyms, service and retail businesses and to minimize local traffic's use of Latrobe Road.

- **Royal Oaks Drive:** is a two-lane collector road within the Blackstone neighborhood of the Valley View Specific Plan. It provides the southernmost access for Blackstone to Latrobe Road. Royal Oaks Drive includes class 2 bike lanes, curb and gutter, and sidewalks fronting developed parcels.

2.2 Transit Service

El Dorado Transit is the primary public transit service provider in El Dorado County and provides local transit services within and between community areas of the county including Placerville and

Cameron Park. Within the study area, El Dorado Transit provides commuter service connecting a park-and-ride lot, located at the intersection of Latrobe Road and White Rock Road, with downtown Sacramento employment, and several locations in Folsom including the Iron Point Light Rail Station, Ingersoll Way & Parker Drive, Intel, Kaiser Permanente, and Folsom Lake College. Dial-a-ride services are also provided within many portions of El Dorado County, including El Dorado Hills.

2.3 Bicycle Facilities

There are existing class II bike lanes along White Rock Road, Silva Valley Parkway, Latrobe Road, Valley View Parkway, and Blackstone Parkway. A class 1 bike trail fronts the east side of Latrobe Road within the Valley View Specific Plan area between Royal Oaks Drive and the El Dorado Irrigation water treatment plant (4625 Latrobe Road). A short section of Class I trail also connects the Carson Crossing specific plan area to the El Dorado Hills Business Park.

The 2020 Active Transportation Plan[2] calls for a pedestrian overcrossing of US 50 connecting Class 1 bike and pedestrian trails through the Town Center shopping district with the bike and pedestrian trails adjacent to the Raley's shopping center north of US 50. There are also plans for a class 1 shared use path along the Placerville & Sacramento Valley Railroad rail line running to the Southeast from the City of Folsom and skirting the southwestern edge of the Carson Creek Specific Plan area.

2.4 Study Intersections and Segments

The following intersections are included in this evaluation and are marked in the preceding **Figure 3**:

1. El Dorado Hills Blvd/Serrano Pkwy
2. El Dorado Hills Blvd/Saratoga Way
3. El Dorado Hills Blvd/US 50 WB
4. El Dorado Hills Blvd/US 50 EB
5. Latrobe Road/Town Center Boulevard
6. Latrobe Road/White Rock Road
7. Latrobe Road/Golden Foothill Parkway (N)
8. Latrobe Road/Suncast Lane
9. Latrobe Road/ Golden Foothill Parkway (S)
10. Latrobe Road/Investment Boulevard
11. Latrobe Road/Avanti Drive
12. Latrobe Road/Royal Oaks Drive
13. Golden Foothill Pkwy/Robert J. Mathews Pkwy
14. Investment Boulevard/Robert J. Mathews Pkwy
15. Golden Foothill Parkway/Carson Crossing Road
16. Carson Crossing Road/Calypso Circle
17. Carson Crossing Road/Four Seasons Drive

[2] El Dorado County Transportation Commission (2020) El Dorado County Active Transportation Plan, https://www.edctc.org/atp-plans.

18. White Rock Road/Carson Crossing Road
19. White Rock Road/Windfield Way
20. White Rock Road/Post Street
21. White Rock Road/Valley View Parkway
22. White Rock Road/Clarksville Crossing
23. Silva Valley Parkway/US 50 EB ramps
24. Silva Valley Parkway/US 50 WB ramps
25. Latrobe Road/Commercial RIRO driveway
26. Latrobe Road/Wetsel-Oviatt Road
27. Latrobe Road/South Shingle Road

Merge/diverge/weave analysis for traffic entering and exiting US 50 will be conducted on US 50 at the following locations:

Westbound US 50

1. Bass Lake Rd to Silva Valley Pkwy (basic)
2. Silva Valley Pkwy offramp (diverge)
3. Silva Valley Pkwy offramp to the (future) loop onramp (basic)
4. (Future) Silva Valley loop onramp (merge)
5. Silva Valley Pkwy slip onramp to El Dorado Hills Blvd offramp (weave)
6. El Dorado Hills Blvd offramp to onramp (basic)
7. El Dorado Hills Blvd onramp (merge)
8. El Dorado Hills Blvd to EDC line (basic)

Eastbound US 50

9. EDC line to Latrobe Rd (basic)
10. Latrobe Rd slip offramp (diverge)
11. Latrobe Rd loop offramp (diverge)
12. Latrobe Rd offramp to onramp (basic)
13. Latrobe Rd to Silva Valley Pkwy (weave)
14. Silva Valley Pkwy offramp to loop onramp (basic)
15. Silva Valley Pkwy onramp (merge)
16. (Future) Silva Valley slip onramp (merge)
17. Silva Valley Pkwy to Bass Lake Rd (basic)

Arterial segment analysis was conducted for the portion of Latrobe Road and White Rock Road:

i. Latrobe Rd between Royal Oaks Dr and Investment Blvd
ii. Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south)
iii. Latrobe Rd between Golden Foothill Pkwy (south) and Suncast Ln)
iv. Latrobe Rd between White Rock Rd and Town Center Blvd
v. White Rock Rd between Valley View Pkwy to Silva Valley Pkwy

2.5 Study Scenarios

Six scenarios were identified for inclusion in this Traffic Impact Analysis through consultation with the development team and El Dorado County staff. The study determines the weekday AM peak

hour and PM peak hour level-of-service at the study intersections and segments under the following scenarios:

1. Existing 2023 (without Project);
2. Existing 2023 Plus Proposed Project;
3. Existing Plus Approved Projects (EPAP) 2033 (without project);
4. EPAP 2033 Plus Proposed Project;
5. Cumulative 2040 (without project); and
6. Cumulative 2040 Plus Proposed Project.

Existing 2023, and Existing 2023 Plus Proposed Project Scenarios

An analysis of the existing condition, which reflects the traffic volumes and roadway geometry at the time the study was initiated. This scenario is analyzed both with and without Project traffic to identify any Project related traffic deficiencies.

EPAP 2033, and EPAP 2033 Plus Proposed Project Scenarios

These scenarios, with and without the Project, will analyze conditions ten years from the current year calculated using a straight-line interpolation from existing traffic levels to the General Plan's 2040 traffic projections. These scenarios will expressly include an interpolated level of traffic from all projects with development agreements and approved tentative maps.

Cumulative 2040, and Cumulative 2040 Plus Proposed Scenarios

The Cumulative 2040 scenario reflects market rate buildout of the nearby specific plan areas and approved tentative maps in the El Dorado Hills area. This scenario was analyzed both with and without Project traffic to identify any Project related traffic deficiencies.

CEQA VMT analysis was performed for the existing and cumulative analysis scenarios.

3.0 TRAFFIC IMPACT ANALYSIS METHODOLOGY

This section provides a process overview, discusses traffic forecasting, and describes the methods/criteria used to evaluate level-of-service. A discussion of the criteria for conformity with General Plan level-of-service policies is included. California Environmental Quality Act (CEQA) analysis of transportation is limited to vehicle miles of travel (VMT). A discussion of CEQA significance thresholds for VMT is also included.

3.1 Process Overview

The overall analysis process was structured to identify potential adverse Project traffic effects relative to either conformity to General Plan level-of-service policies, or CEQA VMT impacts.

- Traffic counts collected in 2023 and crosschecked against historic 2017 and 2018 counts.
- Traffic volumes and turning movements for the Existing 2023 conditions were determined from traffic counts. Future-year volume forecasts were based on growth estimates from the El Dorado County travel demand mode (TDM)[3] applied to the observed count data. The NCHRP 255 procedure[4] was used to refine forecasted turning movements.
- Study intersections, arterial segments, and the US 50 segments were analyzed both with and without the proposed Project to identify potential Project impacts.
- General Plan level-of-service thresholds were based on El Dorado County General Plan, Transportation and Circulation Element policies TC-Xa (Measure Y and Measure E policies), TC-Xd and TC-Xe.
- CEQA thresholds of significance for VMT are based on guidance adopted by the Board of Supervisors on October 6, 2020.

3.2 Traffic Forecasting Methodology

The TDM catalog "EDC_CAT_082118" was used to generate existing and future traffic volume estimates for calculation of growth factors, and to estimate the distribution for trips generated by the Project. The TDM includes a 2018 baseline and 2040 cumulative scenario. Straight line interpolation was applied to estimate incremental growth from the base year through 2023, 2030, and 2040.

TDM Segment Level Calibration

The TDM was calibrated to local roadways by estimating and applying link level adjustment factors based on the difference between traffic counts and a 2023 TDM scenario. That calibration factor is applied to the 2023, 2033, and 2040 TDM results to improve the accuracy of the volume forecasts at each intersection. The NCHRP 255 process was used in combination with observed turning movements, and the calibrated 2020, 2030, and 2040 model volumes, to refine turning movements for no-Project conditions.

[3] El Dorado Travel Demand Model version "EDC_CAT_082118".
[4] Transportation Research Board (1982) National Cooperative Highway Research Program Report 255, Washington D.C.

Baseline 2016 TDM Network

The TDM network within the Folsom Ranch area for the 2018 baseline model runs assumed that traffic crossing the El Dorado County Line on White Rock Road would use Scott Road (AKA East Bidwell Street) for US 50 access. Placerville Road and Alder Creek Parkway to East Bidwell Street provides a more direct path. This shorter route exists today and Folsom's General Plan update (adopted 8/28/2018) preserves that Placerville Road-Alder Creek Parkway route through the Folsom Plan Area. Therefore, these network links were connected and turned on for the baseline 2018 model runs.

2040 Traffic Forecasts and Interpolation of 2030 Link Volumes

Growth in traffic for the EPAP scenario was based on linear interpolation of segment volumes between the Baseline 2018 scenario (with the Saratoga Way extension), and a cumulative (2040) TDM scenario. Land use was checked to ensure that it reflected a reasonable degree of buildout of the nearby specific plan areas and to ensure that interpolation of that land use would account for all approved tentative maps in the El Dorado Hills area.

- The model reflects buildout of the Carson Creek Specific Plan housing. There are 1,700 age-restricted dwelling units currently allowed within the CCSP. Age restricted dwelling units have lower trip generation than traditional homes[5] and the TDM reflects this by coding the land use as a smaller number of traditional homes. The 1,700 age-restricted homes would be reflected as 765 traditional single-family homes in the TDM. The model includes 1,042 homes in the CCSP area (reflecting approximately 2315 age-restricted homes). The County's buildout estimate is conservatively high and was not adjusted.
- Buildout of the El Dorado Hills Specific Plan is included in the 2040 model land use.
- Buildout of Promontory is included in the 2040 model land use.
- Buildout of Valley View Specific Plan (VVSP) (Blackstone) White Rock Village and West Valley Village is included in the 2040 model land use.
- Bass Lake Hills is a little under 85% built out (1,217 DUs out of 1,448) by 2040. Based on the rate of buildout of the Bass Lake Hills Specific Plan area the assumption of 85% buildout appears conservative and was not increased.

The 2040 model network was also updated to include the Mangini Parkway connection between Placerville Road and East Bidwell Street in the Folsom Plan area.

3.3 Intersection Turn Movement Forecast Methodology

Directional link level volume estimates from the 2018 and 2040 TDM model forecasts were used to scale traffic counts using the NCHRP 255 methodology. The methodology was applied through the TurnsW32 v2.0 software[6]. TDM result plots are provided in **Appendix C**. The Furness reports

[5] Age restricted housing generates about 45% of the daily trips of traditional housing, 33% of the AM peak hour trips, and 30% of the PM peak hour trips (Source: ITE Trip Generation Manual, 10th edition).
[6] Dowling Associates (2002), http://sites.kittelson.com/kittelsondownloads/Downloads/Download/12544.

for the AM and PM peak hour turn movement forecasts under EPAP 2033 and Cumulative 2040 conditions are provided in **Appendix D**.

3.4 VMT Modeling Methodology and CEQA Significance Thresholds

VMT was analyzed based on extracting information from an unmodified version of the El Dorado County TDM. Before discussing the specific approach, background information on how the El Dorado County TDM works is appropriate. The TDM is a traditional trip based four-step travel demand model (trip generation, distribution, mode choice and assignment) with a 2018 base year and 2040 horizon year. Trip productions and attractions are estimated at the transportation analysis zone (TAZ) level. Within developed portions of the County, TAZs are roughly neighborhood size areas for which population socioeconomic data is tabulated. (TAZs are larger in less populated rural portions of the County). Trips are estimated by trip purpose based on eight purposes:

- Home based work,
- Home based shop,
- Home based school,
- Home based other,
- Work other,
- Other-other,
- Commercial two axle, and
- Commercial 3+ axle

As trips are estimated and processed by the model, they are converted from productions and attractions by purpose to origins and destinations by class (single occupancy, shared ride, commercial two-axle and commercial three-plus-axle. Trips are then assigned to the network by class using the origin-destination data. Through trips are also assigned based on an external origin-destination table. Both the production-attraction and origin-destination data are preserved in large matrices which can be leveraged to disaggregate the model's VMT estimates into VMT by trip purpose for evaluating the residential portion of the Project.

There are 674 TAZs in the model (25 of which represent external gateways) connected by 7,171 road segments. Each Taz is represented by a centroid corresponding to the approximate center of travel activity with the TAZ. Each road segments includes relevant characteristics (location, uncongested speed, number of lanes, capacity, etc.) that allow the model to estimate travel times as trips are assigned to the network. **Figure 4** depicts the model road network with dots reflecting the centroid of each TAZ and red dots reflecting the model gateways. TAZ 612 where the project is located is represented by a red star. **Figure 5** then shows the shape and extent of TAZ's near the Project site, with TAZ 612 (where the Project is located) and adjacent residential TAZes which are predominantly residential (167 and 611) labeled.

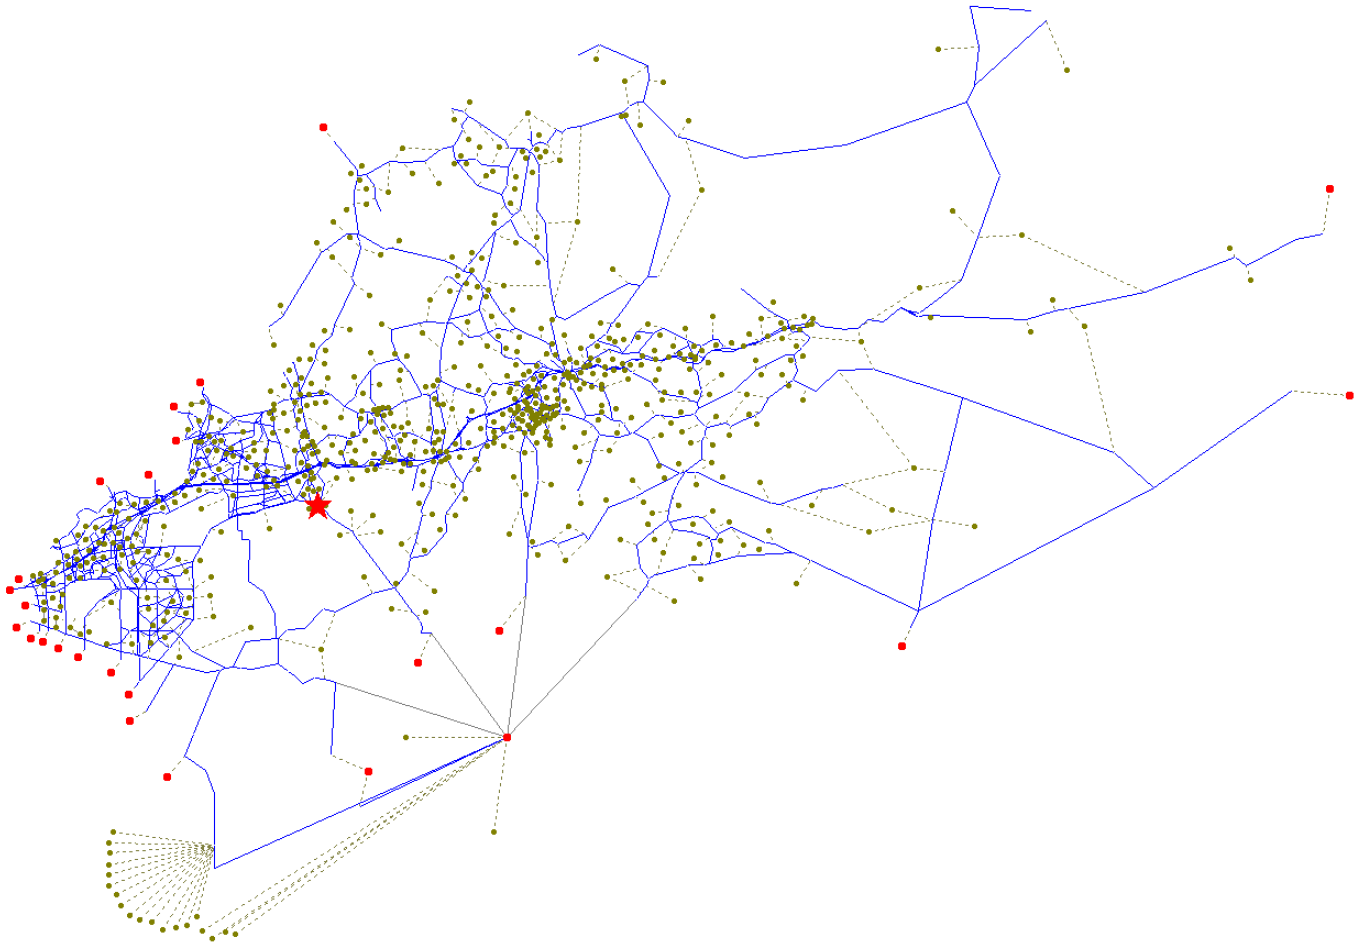

Figure 4. Travel demand model network and zone layout, Project TAZ (#612) shown as a star

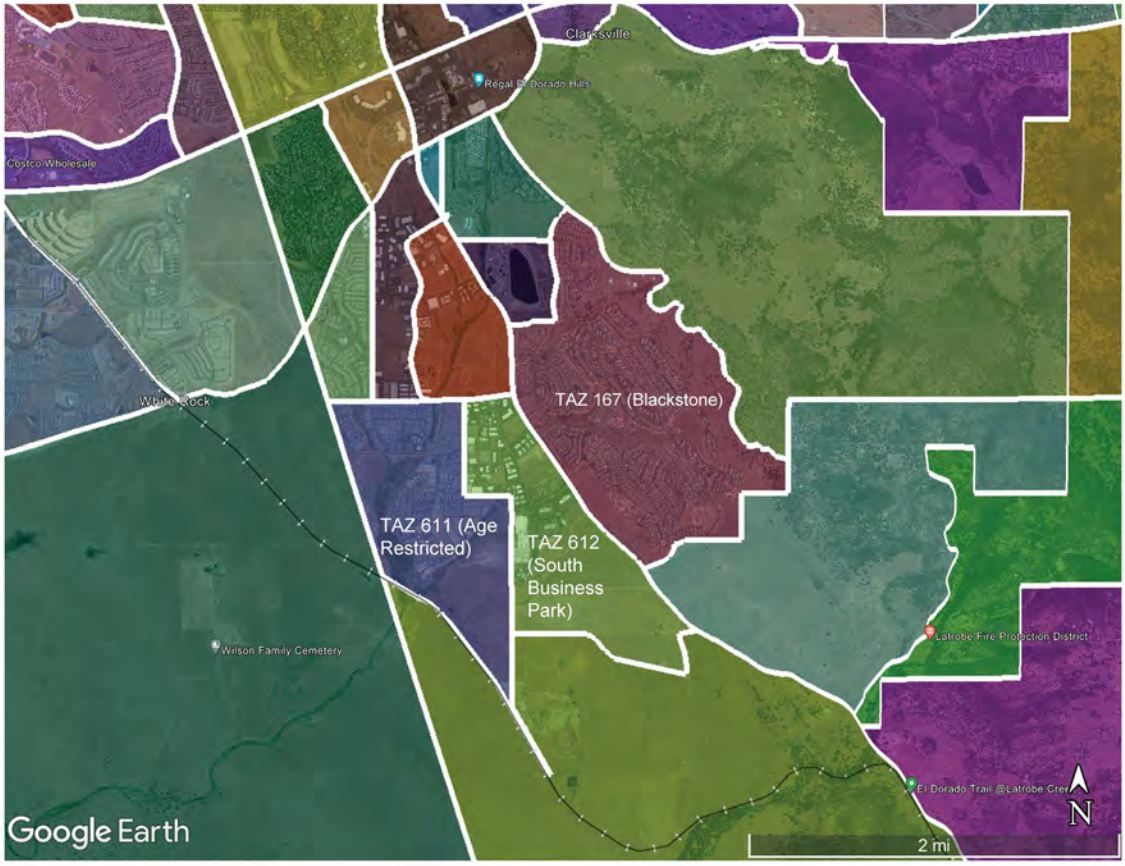

Figure 5. TAZ layout in the Project vicinity.

A three-step process for the baseline and cumulative analysis years was used to estimate per capita home based VMT.

Step 1. This step estimated TAZ[7]-to-TAZ distances from TDM skims, then combined those data with the number of TAZ-to-TAZ trips from the model's OD tables to estimate TAZ-to-TAZ VMT for drive along, shared ride, and commercial vehicles. Using the loaded networks accounts for any increases in trip distance that may result from congestion. In this step, model gateway trip lengths were adjusted based on **Table 1**. Those adjustments reflect the anticipated trip lengths for travel to/from El Dorado County from other parts of the region and state. This adjustment ensures that the TDM accounts for the full length of trips entering and exiting the County. The lengths for intrazonal trips (which have their origin and destination within the same TAZ) were estimated as half of the length of the

[7] TAZs are "transportation analysis zones", which are typically neighborhood size regions for which land use and demographic details, such as housing, employment, and population data are tabulated. The El Dorado County TDM has 674 TAZs.

TAZ's shortest centroid connector, which is the industry standard practice, and consistent with the County's VMT estimates.

Table 1. Average trip-length adjustments for TDM gateways

ID	Gateway Location	Average Additional Travel Distance (miles)	
		Internal to External (IX) Trips	External to Internal (XI) Trips

Note: Internal to External (IX) trips are trips that begin inside the El Dorado County model area and end outside. External to Internal (XI) trips are trips that begin outside the El Dorado County model area and end inside. Source: California Statewide Travel Demand Model.

Source: California Statewide Travel Demand Model as cited by Fehr and Peers in the Central El Dorado Hills Specific Plan VMT Analysis Memorandum dated January 5, 2021.

Step 2 This step estimated drive along, shared ride, and commercial vehicle trips by trip purpose from TDM trip production and attraction matrices. Then converted those data to the fraction of trip origins and destinations by trip purpose for each TAZ.

Step 2 The final step used the trip purpose data for each TAZ from task 2 to disaggregate the VMT data for each TAZ from task 1 into TAZ-to-TAZ VMT by trip purpose. Home based trips were assumed to consist of "home-based work", "home-based shop", "home-based school", "home-based other", and a portion of "other-other". Work-based trips were estimated as "work-other" and a portion of "other-other" trips. The other-other trips were allocated to the housing-based or work-based groups based on the ratio of home-other to work-other trips for each TAZ.

The resulting tables were summarized over unincorporated El Dorado County, and for TAZ 167 which was used as a surrogate for the Project[8]. TAZ 167 represents the Blackstone neighborhood across Latrobe Road from the Project. Blackstone was assumed to be the best available proxy for household size and income characteristics of the Project. It is likely a conservative comparison as the Project is envisioned to offer a wider variety of housing options with a diverse mix of housing styles and prices, where Blackstone was aimed at a higher income demographic. VMT per capita tends to increase as household income increases. The TDM is based in the CUBE software package by Bently Systems. Scripts used in each calculation step are provided **Appendix E**.

VMT Thresholds

The County's VMT thresholds set an identifiable metric by which the Project's effect on VMT will be determined to be significant or less-than-significant. Land use specific thresholds have been adopted as follows:

- Residential: 15% below baseline unincorporated countywide VMT per capita,
- Office: 15% below baseline unincorporated countywide VMT per capita,
- Retail: no net increase in VMT.

As noted by the Governor's Office of Planning and Research, adding local-serving retail into the urban fabric improves retail destination proximity. Local-serving retail development tends to shorten trips and reduce VMT. Thus, lead agencies may presume such development creates a less-than-significant impact. (Regional serving retail on the other hand can substitute longer trips for shorter ones, which may lead to a significant impact.)

[8] Using a nearby TAZ as a surrogate avoids the need to artificially manipulate the socioeconomic distribution assumptions for the affected population. When a new TAZ is used, the distribution of socioeconomic characteristics for the households is copied and scaled from a similar nearby TAZ (i.e., TAZ 167). Using the existing TAZ as a surrogate maintains the County wide population and employment control totals that were adopted by the Board of Supervisors when the travel demand model and major TIF update are adopted. Artificially inflating the county wide population and employment can have nonsensical impacts on the resulting per capita VMT estimates.

The Governor's Office of Planning and Research advises lead agencies evaluate each component of a mixed-use project independently and apply the significance threshold for each project type included (e.g., residential and retail). Alternatively, a lead agency may consider only the project's dominant use. In the analysis of each use, a project should take credit for internal capture. Combining different land uses and applying one threshold to those land uses may result in an inaccurate impact assessment.

For Creekside Village, the residential portion of the Project is evaluated based on the 15% reduction from baseline threshold listed above. The retail portion of the Project is considered local-serving retail and presumed to have a less-than-significant impact on VMT.

3.5 Level-of-Service Methodology

Level-of-service (LOS) is a qualitative indication of the level of delay and congestion experienced by motorists using an intersection. Levels-of-service are designated by the letters A through F, with "A" being the best conditions and "F" being the worst (high delay and congestion). Calculation methodologies, measures of performance, and thresholds for each letter grade differ for road segments, signalized intersections, and unsignalized intersections. LOS is analyzed only to demonstrate consistency with the General Plan. LOS is no longer the metric by which traffic impacts are analyzed for CEQA and the LOS discussion is not relevant to assessing impacts to the environment for purposes of CEQA.

Based on guidance from El Dorado County Community Development Agency staff, and the *County of El Dorado Department of Transportation – Traffic Impact Study Protocols and Procedures* (Dated November 2014), the following procedures described below for intersection traffic operations analysis were selected for this study.

Intersection Traffic Operations Analysis

Signalized Intersections

The methodology from Highway Capacity Manual (HCM) 7th Edition[9] are used to analyze signalized intersections. Level-of-service can be characterized for the entire intersection, each approach, or by lane group. Control delay alone (the weighted average delay for all vehicles entering the intersection) is used to characterize level-of-service for the entire intersection or an approach. Control delay and volume to capacity ratio are used to characterize level-of-service for lane groups. The average delay criteria used to determine the level-of-service at signalized intersections is presented in **Table 2**.

[9] TRB (2022) Highway Capacity Manual 7th Edition, Transportation Research Board, Washington D.C.

Table 2. Level-of-service criteria for signalized intersections

Level -of- Service	Description	Average Delay[1] (Sec. /Vehicle.)
A	Very Low Delay: This level-of-service occurs when progression is extremely favorable, and most vehicles arrive during a green phase. Most vehicles do not stop at all.	≤ 10.0
B	Minimal Delays: This level-of-service generally occurs with good progression, short cycle lengths, or both. More vehicles stop than at LOS A, causing higher levels of average delay.	10.1-20.0
C	Acceptable Delay: Delay increases due to only fair progression, longer cycle lengths, or both. Individual cycle failures (*to service all waiting vehicles*) may begin to appear at this level of service. The number of vehicles stopping is significant, though many still pass through the intersection without stopping.	20.1-35.0
D	Approaching Unstable/Tolerable Delays: The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.	35.1-55.0
E	Unstable Operation/Significant Delays: This is considered by many agencies the upper limit of acceptable delays. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent occurrences.	55.1-80.0
F	Excessive Delays: This level, considered to be unacceptable to most drivers, often occurs with oversaturation (i.e., when arrival flow rates exceed the capacity of the intersection). It may also occur at high v/c ratios below 1.00 with many individual cycle failures. Poor progression and long cycle lengths may also contribute to such delay levels.	> 80.0 or v/c >1.0

Note 1: Weighted average of delay on all approaches. This is the measure used by the Highway Capacity Manual to determine level-of-service. Any movement with a volume to capacity ratio (v/c) greater than 1.0 is considered to be level-of-service "F".

Source: Transportation Research Board (2022) Highway Capacity Manual, 6th Edition, Washington D.C., Chapter 19;

Unsignalized Intersections

The methodology from HCM 7th Edition is used for the analysis of unsignalized intersections. For unsignalized intersections, most of the main street traffic is un-delayed, and, by definition, have acceptable conditions. The main street left-turn movements and the minor street movements are all susceptible to delay of varying degrees. Generally, the higher the main street traffic volumes, the higher the delay for the minor movements. Separate methods are utilized for two-way stop-controlled (TWSC) intersections, and all-way stop-controlled (AWSC) intersections.

- **TWSC**: The methodology for analysis of two-way stop-controlled intersections calculates an average total delay per vehicle for each minor street movement and for the major

street left-turn movements, based on the availability of adequate gaps in the main street through traffic. A level-of-service designation is assigned to individual movements or to combinations of movements (in the case of shared lanes) based upon delay, it is not defined for the intersection as a whole. Unsignalized intersection level-of-service reported herein is for each movement (or group of movements) based upon the respective average delay per vehicle. **Table 3** presents the average delay criteria used to determine the level-of-service at TWSC and at AWSC intersections.

- **AWSC:** At all-way stop-controlled intersections, the level-of-service is determined by the weighted average delay for all vehicles entering the intersection. The methodologies for these types of intersections calculate a single weighted average delay and level-of-service for the intersection, as a whole. The average delay criteria used to determine the level-of-service at all-way stop intersections is the same as that presented in **Table 3**. Level-of-service for specific movements can also be determined based on the TWSC methodology.

It is not unusual for some of the minor street movements at unsignalized intersections to have level-of-service D, E, or F conditions while the major street movements have level-of-service A, B, or C conditions. In such a case, the minor street traffic experiences delay that can be substantial for individual minor street vehicles, but the majority of vehicles using the intersection have very little delay. Usually in such cases, the minor street traffic volumes are relatively low. If the minor street volume is large enough, improvements to reduce the minor street delay may be justified, such as channelization, widening, roundabout, or signalization.

Table 3. Level-of-service criteria for unsignalized intersections

Level of Service (LOS)	Description	TWSC[1] Average Delay by Movement (seconds / vehicle)	AWSC[2] Intersection Wide Average Delay (seconds / vehicle)
A	Little or no delay	< 10	< 10
B	Short traffic delay	> 10 and < 15	> 10 and < 15
C	Average traffic delays	> 15 and < 25	> 15 and < 25
D	Long traffic delays	> 25 and < 35	> 25 and < 35
E	Very long traffic delays	> 35 and < 50	> 35 and < 50
F	Extreme delays potentially affecting other traffic movements in the intersection	> 50 (or, v/c >1.0)	> 50

Note 1: Two-way stop-control (TWSC) level-of-service is calculated separately for each minor street movement (or shared movement) as well as major street left turns using these criteria. Any movement with a volume to capacity ratio (v/c) greater than 1.0 is considered to be level-of-service F.

Note 2: All-way stop-control (AWSC) assessment of level-of-service at the approach and intersection levels is based solely on control delay.

Source: Transportation Research Board (2022) Highway Capacity Manual, 7th Edition, Washington D.C., Chapter 20 (TWSC) and Chapter 21 (AWSC).

Signal Warrants

At each unsignalized intersection, the potential need for a traffic signal was evaluated. Traffic signal warrants are a series of standards that provide guidelines for determining if a traffic signal is appropriate. Signal warrant analyses are typically conducted at intersections of uncontrolled major streets and stop sign-controlled minor streets. If one or more signal warrants are met, signalization of the intersection may be appropriate. However, a signal should not be installed if none of the warrants are met, since the installation of signals would increase delays on the previously uncontrolled major street and may increase the occurrence of particular types of accidents.

As stated in revision 8 of the 2014 California Edition of the Manual on Uniform Traffic Control Devices (California MUTCD 2014)[10], "*The investigation of the need for a traffic control signal shall include an analysis of factors related to the existing operation and safety at the study location and the potential to improve these conditions, and the applicable factors contained in the following traffic signal warrants:*

- *Warrant 1, Eight-Hour Vehicular Volume*
- *Warrant 2, Four-Hour Vehicular Volume*
- *Warrant 3, Peak Hour*
- *Warrant 4, Pedestrian Volume*
- *Warrant 5, School Crossing*
- *Warrant 6, Coordinated Signal System*
- *Warrant 7, Crash Experience*
- *Warrant 8, Roadway Network*
- *Warrant 9, Intersection Near a Grade Crossing*

The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal."

Consistent with the industry standard of practice, this Traffic Impact Analysis did not evaluate the full panoply of warrants for traffic signals, but instead focused on the peak hour warrant. The MUTCD states that, "*This [peak hour] signal warrant shall be applied only in unusual cases, such as office complexes, manufacturing plants, industrial complexes, or high-occupancy vehicle facilities that attract or discharge large numbers of vehicles over a short time.*" So, the peak hour warrant is being used in this impact analysis study as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed the peak hour warrant are considered (for the purposes of this impact analysis) to be likely to meet one or more of the other signal warrants (such as the 4-hour or 8-hour warrants). This peak hour analysis is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction.

[10] Caltrans (2024) California Manual on Uniform Traffic Control Devices - FHWA's MUTCD 2009 Edition as amended for use in California - 2014 Edition - Revision 8, January 11, 2024. Section 4C.

Unsignalized intersections were evaluated using the Peak Hour Volume Warrant (Warrant No. 3) in the California MUTCD 2014. The Peak Hour Volume Warrant was applied where the minor street experiences long delays in entering or crossing the major street for at least one hour in a day.

Even if the Peak Hour Volume Warrant is met, a more detailed signal warrant study is recommended before a signal is installed. The more detailed study should consider volumes during the daily peak hours of roadway traffic, pedestrian traffic, and accident histories.

El Dorado County Roadway Segments

Several methods are available to evaluate roadway segments. The methodology selected for this analysis was chosen to be consistent with the 2014 El Dorado County Transportation Impact Study Guidelines.

Table 1 of that document contains the maximum flow rates for each level-of-service grade as a function of roadway classification. Those level-of-service criteria are shown in **Table 4**.

Table 4. Level-of-service criteria for county roadway segments

		HCM 2010 Planning Level Volumes[1]				
Code	**Functional Class Codes (Updated to HCM 2010)**	**A**	**B**	**C**	**D**	**E**

Arterial LOS based on HCM 2010, Exhibit 16-14, K-factor of 0.09, posted speed 45 mi/h

Volumes are for both directions unless noted

Caltrans Merge/Diverge/Weave Level-of-Service Analysis

Freeway merge/diverge segments, basic segments, and weaving segments were analyzed utilizing the methodologies outlined in Chapters 12-14 of the Highway Capacity Manual, 7th Edition (HCM 2016)[11]. Freeway operations and level-of-service is defined by density (passenger cars per mile per lane) which depends upon traffic volumes and the ramp characteristics. These characteristics include the length and type of acceleration/deceleration lanes; free-flow speeds; number of lanes;

[11] Transportation Research Board (2022) Highway Capacity Manual, 7th Edition, Washington, D.C.

grade; and types of facilities. **Table 5** through **Table 7** shows the relationship of level-of-service to freeway density. Note that the Leisch Method[12], which Caltrans prefers for weaving segments, was not applied because the State of California no longer considers level-of-service under CEQA, and the Leisch Method is not relevant to adopted General Plan policies.

Table 5. Level-of-Service Criteria – Basic freeway segment

Level of Service	Maximum Density (passenger vehicles per mile per lane)
A	0-11
B	>11-18
C	>18-26
D	>26-35
E	>35-45
F	>45, or demand exceeds capacity

3.6 General Plan Level-of-Service Standards

Conformity to General Plan level-of-service policies for the Project were determined based on the methods described above and identified as either "significant" or "less-than-significant" in accordance with El Dorado County protocols and procedures[13] . However, level-of-service is only applicable to General Plan conformity. Delay and level-of-service is not a significant impact under CEQA.

General Plan Circulation Policy TC-Xd provides that level-of-service for county-maintained roads and state highways within the unincorporated areas of the county shall not be worse than level-of-service E in the community regions or level-of-service D in the rural centers and rural regions, unless specifically exempted as shown in **Table 8**.

Table 8. General plan exceptions to level-of-service standards

El Dorado County Roads Allowed to Operate at Level-of-Service F[a] (Through December 31, 2029)		
Road Segments		**Max. v/c[b]**
Cambridge Road	Country Club Drive to Oxford Road	1.07
Cameron Park Drive	Robin Lane to Coach Lane	1.11
Missouri Flat Road	US 50 to Mother Lode Drive	1.12
	Mother Lode Drive to China Garden Road	1.20
Pleasant Valley Road	El Dorado Road to State Route 49	1.28
US 50	Canal Street to junction of State Route 49 (Spring Street)	1.25
	Junction of State Route 49 (Spring Street) to Coloma Street	1.59
	Coloma Street to Bedford Avenue	1.61
	Bedford Avenue to beginning of freeway	1.73
	Beginning of freeway to Washington overhead	1.16
	Ice House Road to Echo Lake	1.16
State Route 49	Pacific/Sacramento Street to new four-lane section	1.31
	US 50 to State Route 193	1.32
	State Route 193 to county line	1.51

Note a: Roads improved to their maximum width given right-of-way and physical limitations
Note b: Volume-to-capacity ratio.
Source: 2004 General Plan (amended January 2009) Table TC-2

All but two study intersections are within the El Dorado Hills community region and shall operate at level-of-service E or better. Intersection #22 (White Rock Rd/Clarksville Crossing) and #23 (White Rock Road/US 50 EB) are outside of the community region and shall operate at level-of-service D or better. If a project causes the peak hour level-of-service or volume/capacity ratio on a county road or state highway that would otherwise meet the county standards (without the project) to exceed the values listed in the above tables and text, then the impact shall be considered significant. Because this Traffic Impact Analysis is not a CEQA document, facilities and intersections will be noted as having deficient level-of-service rather than an impact.

[13] Traffic Impact Study Protocols and Procedures, County of El Dorado, Department of Transportation, 2008.

If any county road or state highway fails to meet the above listed county standards for peak hour level-of-service or volume/capacity ratios under without Project conditions, and the Project will "significantly worsen" conditions on the road or highway, then the impact shall be considered significant. The term, "significantly worsen" is defined for the purpose of this paragraph according to General Plan Policy TC-Xe as follows:

A. A two percent increase in traffic during the AM peak hour, PM peak hour, or daily; or,

B. The addition of 100 or more daily trips; or,

C. The addition of 10 or more trips during the AM peak hour or the PM peak hour.

Though not explicitly stated in the General Plan policies, 95% left turn queues that exceed available storage lengths are considered to operate deficiently. The highway capacity manual calculations assume that left turn queues do not typically spill out of turn pockets to block through traffic. In keeping with the state of the practice, where the Project adds less than one car length (25 feet) to 95% left turn queues that exceed available storage, that addition is considered to de minimis.

3.7 Analysis Tools

El Dorado County Travel Demand Model (TDM)

As noted in prior sections, The El Dorado County Travel Demand Model (version EDC_CAT_082118) was utilized to estimate VMT and forecast growth in traffic volumes on study area roadways.

NCHRP 255 Adjustment

The NCHRP 255[14] adjustment procedure was used to improve turning movement forecasts for EPAP 2030 and Cumulative 2040 conditions.

Macroscopic Intersection Analysis

Control delay and level-of-service for study intersections were calculated using PTV Vistro[15] traffic analysis software (Version 2024, SP 0-2). Vistro is a complete traffic analysis software package used for evaluating development impacts, optimizing traffic signal timings, and evaluating intersection levels of service. It implements the methodologies of the HCM 2000, 2010, and 6th Ed. for signalized and unsignalized intersections, and requires data on road characteristics (geometric), traffic counts, and the signal timing data for each analysis intersection.

When calculating intersection control delay and level-of-service for all study intersections, default parameters were used, except for locations where specific field data were available (e.g., peak-hour factors). Heavy vehicle percentages during the peak-hour of 2% were assumed.

[14] Transportation Research Board (1982) National Cooperative Highway Research Program Report 255, Washington D.C.
[15] PTV Vistro (2017), Portland OR.

(This page intentionally left blank)

4.0 EXISTING (2023) CONDITIONS

4.1 Data Sources

The analysis tools require a variety of data to generate the evaluation criteria. The following sections describe data collection procedures for Existing Conditions. There were three primary data elements (roadway characteristics, intersection turning movement counts, and traffic control data); and two supplementary elements (other recent studies, and field data) that comprised the data collection program for this traffic analysis.

Roadway Geometry and Usage Characteristics

The geometry and usage data for the analysis were collected using aerial photographs, field visits, and prior studies. Current intersection geometry was field validated. **Table 9** shows the key items included in the geometric data and the source for each item.

Table 9. Key items and sources for geometry and usage data

Key Item	Source
Lane configurations & width	Aerial photographs and field visits
Lane utilization	Prior studies, aerial photographs, and field visits
Intersection spacing	Aerial photographs and field visits
Length of storage bays	Aerial photographs and field visits
Transit stops and routes	Transit schedules, aerial photographs, and field visits
Turn prohibitions or allowance	Aerial photographs and field visits
Signal timing	Timing sheets provided by El Dorado County

Lane configurations and width – These data specify the number of lanes and the width of the roadway in each direction, and the directional turns that are allowed from each lane.

Lane utilization – These data specify how lanes are used by drivers, such as traffic distribution between lanes on a multi-lane roadway.

Intersection spacing – These data refer to the distance between intersections, which is recorded in feet.

Length of storage bays – These data refer to the length (feet) of available storage for left- or right-turning vehicles where exclusive turn lanes are available. These data are collected for right-turn lanes when the parking lane is used as a right- turn lane.

Transit stops and routes – A transit stop is an area where passengers await, board, alight, and transfer between transit vehicles. A transit route is the roadway that transit vehicles operate on.

Turn prohibitions or allowance – This data specifies if right turns on red (RTOR) are allowed on the roadway.

Intersection Turning Movement Counts

Existing morning and evening peak-period vehicle and pedestrian turning movement counts collected in April 2023 were used for this study. Historic 2017 and 2018 counts were also used as a “floor” to ensure that there were no COVID related reductions in the 2023 counts. Traffic count

data sheets are provided in **Appendix A** of this report. Traffic volumes between intersections were balanced where differences could not reasonably be attributed to a vehicle platoon being held at one of the lights, driveway access between intersections, or shifts in the time of the peak hour from one intersection to another. All balancing was done by adding vehicle trips to the 2023 turning movements. Observed intersection peak hour factors (PHF) were applied. **Figure 6** provides a summary of the intersection lane geometry and peak period turning movements under Existing 2023 conditions.

Segment Counts

Turning movement counts can significantly overstate segment volumes. The practice of balancing traffic flows between adjacent intersections when counts may have been collected on different days and/or the corresponding intersections experience slightly different peak-hours can make those counts too conservative to apply to the segments.

Segment counts collected by El Dorado County on multiple days in 2023 and the development team were used to analyze road segments. Segment counts are summarized in **Table 12** below. Raw count data can be found in **Appendix A.**

4.2 Existing Condition Intersection and Segment Level-of-Service

Table 10 through **Table 12** present a summary of level-of-service results for the study intersections and segments under Existing 2023 conditions. Intersection control is listed as signal, two-way stop-controlled (TWSC), or all-way stop-control (AWSC). Both the estimated delay and level-of-service (LOS) is provided. At TWSC intersections, the movement with the worst delay is shown in parentheses. Ninety-fifth percentile left turn queues are also listed. Entries shown in **bold black** typeface denote deficient traffic operations, and unsignalized intersections that meet the peak hour signal warrant are denoted with an asterisk and shading.

The results indicate fourteen study intersections operate deficiently with level-of-service F conditions and/or 95% left turn queues that exceed available storage lengths.

- (20) White Rock Road/Post Street: AM and PM; and
- (21) White Rock Road/Valley View Parkway: AM and PM.

Calculation sheets for delay and level-of-service are provided in **Appendix B**. The remainder of the study intersections, all of the US 50 study segments, and arterial study segments were found to operate acceptably.

White Rock Rd between Valley View Pkwy to Silva Valley Pkwy	2-lane arterial (threshold 1650)	1194	1440

5.0 ASSESSMENT OF PROPOSED CREEKSIDE VILLAGE PROJECT

5.1 Proposed Project Trip Generation

Anticipated Traffic generation by the Project reflects both trips generated by the Project itself, and, avoided trips in 2033 and 2040 from the commercial land uses that the El Dorado County TDM assumes will take place on the Project parcels.

Project Trips

Anticipated trips are based on Institute of Transportation Engineers (ITE) Trip Generation Manual, 11th Edition (2021). **Table 13** shows anticipated Project Trip Generation. To be conservative, trip generation estimates are generally based on the higher rates for the peak hour of the generator rather than the peak hour of adjacent street traffic. The higher of either the average trip generation rate or equation-based trip generation rate was also used. Use of these higher rates has historically been preferred by El Dorado County. Pass by trip estimates for the commercial uses are based on both the ITE Trip Generation Manual 11th Edition's electronic appendices and the more detailed ITE Trip Generation Handbook 3rd Edition[16] The ITE data was parsed to better reflect the Project. Specifically pass-by rates for the morning were limited to locations where data was available for the 7-9 AM period (which eliminates the 68% rate from Kentucky, resulting in a lower pass-by rate). That Kentucky rate was for 6-9 AM, and for a larger store (3.3 ksf). The AM pass-by rate also included the 44% pass-by rate from Chicago which is in the 3rd Ed of the Trip Gen Handbook, but not in the newer electronic appendices. For the evening peak we only considered the studies reflecting 4-6 PM for sites that are no larger than the proposed use of 2.4 ksf. The resulting rate was 67.5% (the table footnote says 68%). Note that one needs to look at both the Trip Generation Handbook and the Trip Generation Manual to identify the time periods that the data in the electronic appendix reflect.

Trip Distribution with Adjustment for Latrobe Elementary

Project trip distribution was based on the El Dorado County TDM, observed counts, prior studies in the vicinity of the Project, and consultation with El Dorado County staff. Additional adjustments were made to reflect school trips to Latrobe Elementary based on student generation statistics published by the school district. Trip distribution is shown in **Figure 7**. Assignment of the Project trips to study intersections is shown in **Figure 8**.

[16] ITE (2017) Trip Generation Handbook, 3rd Ed. Institute of Transportation Engineers, Washington DC.

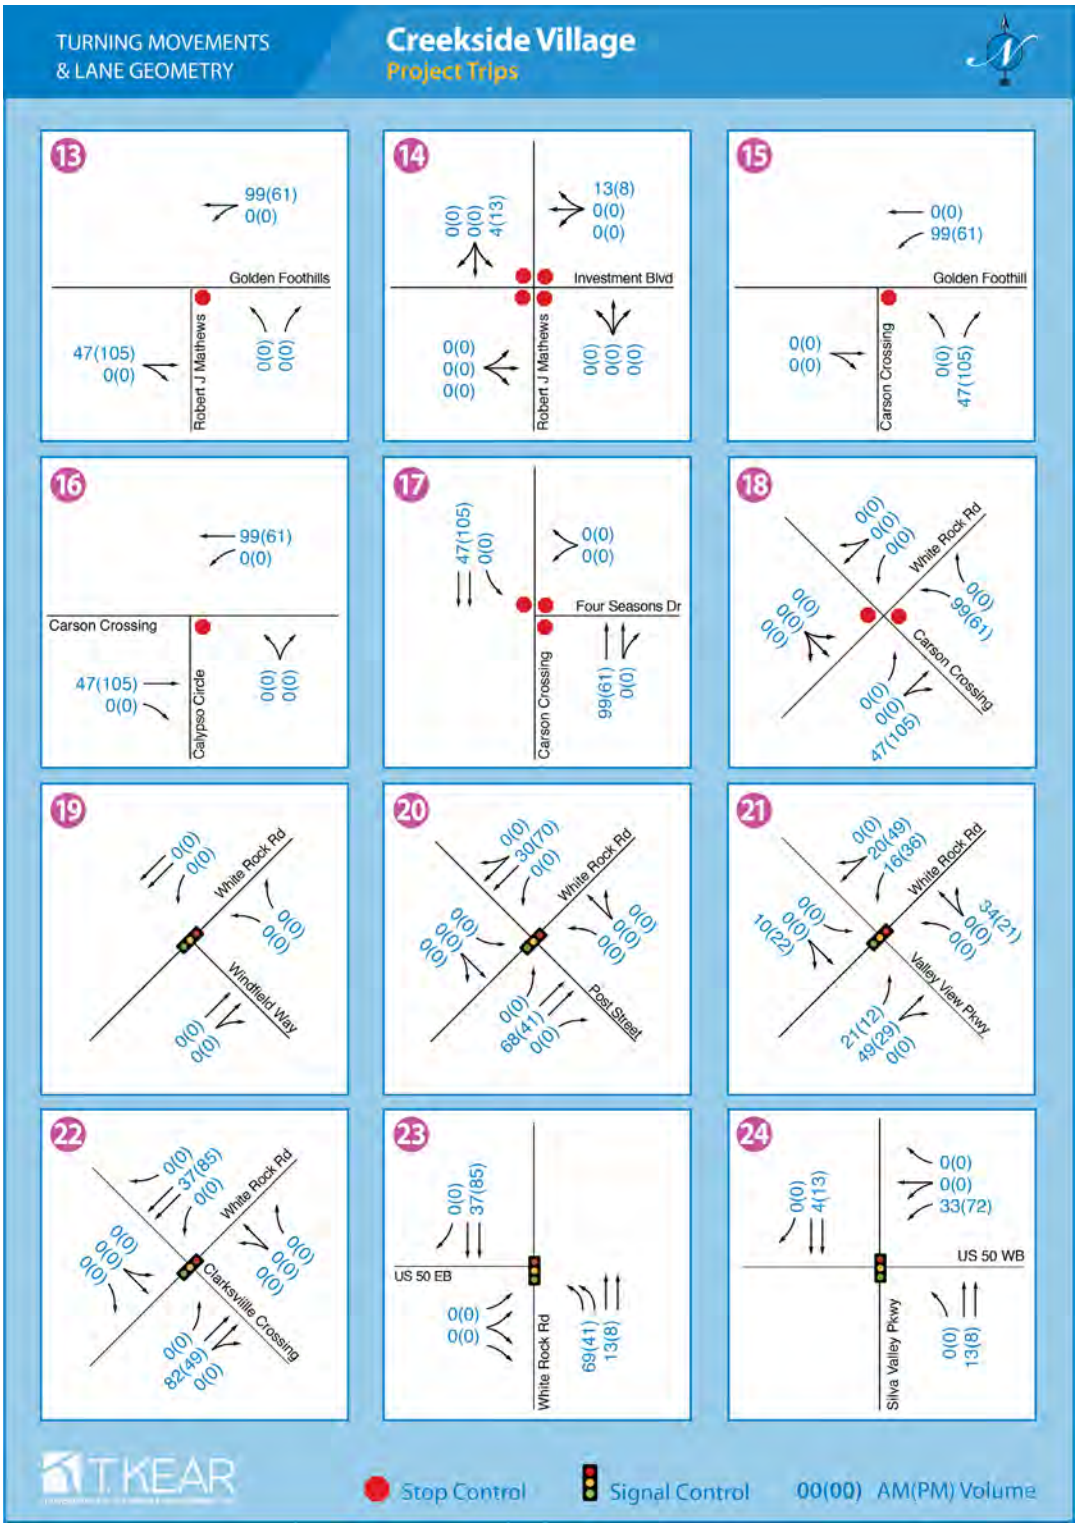

Figure 8. Project trip assignment for 918 dwelling units (continued)

Avoided Trips

Avoided trips are additional peak hour trips that the TDM assumes in the future from growth within the Project TAZ. These avoided trips were estimated by running the TDM with and without assumed 2020[17] through 2040 employment growth for the effected portion of the Project's transportation analysis zone (TAZ 612). Creekside Village replaces 62% of the available land in TAZ 612 (**Figure 9**), therefor 62% of the employment growth was eliminated from TAZ 612 when estimating the number of avoided trips using the TDM. TDM employment assumptions for TAZ 612 are shown in **Table 14** below, along with the resulting avoided trips. Avoided trips for 2040 are shown in **Figure 10**. Using straight line interpolation, 2033 avoided trips reflect the 13 years of unrealized growth from 2020.

[17] 2020 is used rather than 2023 because the process of purchasing the land and de-annexing it from the business park meant that no new employment on this portion of the model TAZ occurred as of that year.

Figure 9. Creekside Village is 62% of available land in TAZ 612

Table 14. TDM employment assumptions and avoided trips

6.0 EXISTING 2023 PLUS PROPOSED PROJECT CONDITIONS

6.1 Traffic Volumes

Peak hour traffic associated with the proposed Project was added to the Existing 2023 Condition scenario's traffic volumes, delay and level-of-service were determined at the study intersections and segments. **Figure 12** summarizes the turning movements and lane configurations for the Existing 2023 Plus Proposed Project scenario.

6.2 Level-of-Service

Table 15 through **Table 17** present a summary of level-of-service results for the study intersections and segments under Existing 2023 conditions with and without Project traffic. Intersection control is listed as signal, two-way stop-controlled (TWSC), or all-way stop-control (AWSC). Both the estimated delay and level-of-service (LOS) is provided. At TWSC intersections, the movement with the worst delay is shown in parentheses. Ninety-fifth percentile left turn queues are also listed. Entries shown in **Bold black** text in **Table 15** through **Table 17** denote locations with preexisting deficiencies that the Project is not anticipated to worsen. **Bold red** text denotes locations where the Project is anticipated to create new or worsen preexisting deficiencies. Unsignalized intersections that meet the peak hour signal warrant are shaded and denoted with an asterisk.

One arterial segment (Latrobe Road between Golden Foothill Pkwy (south) and Investment Blvd) is anticipated to operate at level-of-service F. Sixteen intersections are anticipated to have level-of-service and/or queue spillback deficiencies.

4 Locations that are deficient with or without the Project that are not worsened:

- (1) El Dorado Hills Blvd/Serrano Pkwy AM;
- (7) Latrobe Road/Golden Foothill Parkway (N): PM;
- (19) White Rock Road/Windfield Way AM and PM; and
- (20) White Rock Road/Post Street: AM and PM.

10 Locations that are deficient with or without the Project that are worsened:

- (2) El Dorado Hills Blvd/Saratoga Way: AM and PM;
- (3) El Dorado Hills Blvd/US 50 WB AM and PM;
- (5) Latrobe Road/Town Center Boulevard: PM;
- (6) Latrobe Road/White Rock Road AM and PM;
- (8) Latrobe Rd/Suncast Ln AM and PM;
- (9) Latrobe Road/ Golden Foothill Parkway (S): AM and PM;
- (10) Latrobe Road/Investment Boulevard: AM and PM;
- (13) Golden Foothill Parkway (S)/Robert J. Mathewsws Pkwy PM;
- (18) White Rock Road/Carson Crossing Road PM; and
- (21) White Rock Road/Valley View Parkway: AM and PM.

2 Locations where the Project is anticipated to cause new deficiencies:

- (11) Latrobe Road/Avanti Drive AM and PM; and
- (12) Latrobe Road/Royal Oaks Drive AM and PM.

Calculation sheets for delay and level-of-service are provided in **Appendix B**. the remainder of the study intersections, all of the US 50 study segments, and arterial study segments were found to operate acceptably.

Density in units of passenger cars per mile per lane.

*Prior to the opening of the Saratoga Way extension, Caltrans has reported occasional LOS F conditions during the morning peak for this segment based on planning methods rather than counts.

Table 17. Existing 2023 arterial level-of-service check with and without the Project

Arterial Segment	Description	2023 AM No Project	2023 PM No Project	2023 AM Plus Project	2023 PM Plus Project
Latrobe Rd between Royal Oaks Dr and Investment Blvd	2-lane arterial (threshold 1650)	593	655	1336	1507
Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south)	2-lane arterial (threshold 1650)	1015	932	**1744**	**1763**
Latrobe Rd between Golden Foothill Pkwy (south) and Suncast Ln)	4-lane divided arterial (threshold 3290)	1998	2030	2529	2880
Latrobe Rd between White Rock Rd and Town Center Blvd	8-lane divided arterial (threshold 6280, extrapolated from 6-lane divided arterial)	2931	3018	4572	4483
White Rock Rd between Valley View Pkwy to Silva Valley Pkwy	2-lane arterial (threshold 1650)	1194	1440	1312	1574

6.3 Existing 2023 Plus Project General Plan Deficiency Findings

Level-of-service and queueing impacts are not considered significant under CEQA. Intersections and/or segments where Project traffic creates new or worsens existing exceedances of General Plan policy thresholds are referred to as having a "Project deficiency." There are ten intersections and one arterial segment where the Project is anticipated to create new or worsen existing deficiencies under existing 2023 conditions.

There are two sections that follow describing the segment level abatement measures and intersection level abatement measures. Throughout this document, segment deficiencies are numbered using the segment number (i through v) and a year code (2023 = "A", 2033 = "B", and 2040 = "C"). Intersection abatement measures are numbered using the intersection number (1-27) and the year code (A, B, or C).

All deficiencies and abatements described below include the deficiency number/abatement number and location as a title, followed by a description of the deficiency, the abatement, findings, responsibility, and timing. For certain abatements, a building permit trigger has been analyzed and included to determine the necessary timing for the improvement. For all other abatements, it is assumed the timing would be prior to issuance of the first building permit. If desired, a building permit trigger could also be determined for those abatements.

2023 Segment Deficiencies and Abatement Measures

(ii)A. Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south) in 2023 (CIP Project Latrobe 72)

Deficiency: Level-of-service is anticipated to worsen to F with the addition of Project traffic during the AM and PM peak-hours.

Abatement: Before issuance of the 658th residential building permit or the first commercial building permit, the CIP project Latrobe 72 (widen Latrobe Rd to four-lanes between Investment Blvd and Royal Oaks Dr) shall be included in the 10-year CIP. Latrobe 72 consists of widening Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south) from two-lanes to four-lanes, and all associated improvements at the intersections of Latrobe Rd/Investment Blvd and Latrobe Rd/Golden Foothill Pkwy (south).

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 18** presents the segment level-of-service results with this abatement.

Project Responsibility: The Project is responsible for its fair share of the cost of these off-site improvements which would be addressed by payment of fees after Latrobe 72 is added to the 10-year CIP. Addition of these improvements to the CIP will provide the mechanism to ensure the Project is responsible for its fair share.

Timing: Prior to issuance of the 658th residential building permit or the first commercial building permit. Note the 658th unit constraint is based on the cumulative 2040 scenario which is the most constrained scenario for this deficiency.

Table 18. Existing 2023 arterial level-of-service check with and without the abated Project

Arterial Segment	Description	2023 AM No Project	2023 PM No Project	2023 AM Plus Project	2023 PM Plus Project
Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south)	**Un Abated** 2-lane arterial (threshold 1650)	1015	932	**1744**	**1763**
	Limit Project to 658 dwelling units: 2-lane arterial (threshold 1650)	1015	932	1438	1488
	Add Widening to CIP: 4-lane divided arterial (threshold 3290)	1015	932	1744	1763

2023 Intersection Deficiencies and Abatement Measures

2A. El Dorado Hills Blvd/Saratoga Way in 2023

Deficiency: Level-of-service is F prior to addition of Project traffic, with northbound left-turn queues spilling out of the turn pocket. Project traffic is anticipated to worsen level-of-service and northbound left-turn queues.

Abatement: Construct a 300-foot southbound right turn pocket and adjust signal timing.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** at the end of this section presents intersection level-of-service results with this abatement.

Project Responsibility: This abatement partially implements Project #36105076 in the 10-year Capital Improvement Program (CIP). The Project may satisfy this requirement through payment of applicable fees under the El Dorado County traffic impact Fee (TIF) program.

Timing: Prior to issuance of 1st building permit.

Cross reference: See abatement 2B, which builds on abatement 2A.

3A. El Dorado Hills Blvd/US 50 WB in 2023

Deficiency: Existing AM peak-hour level-of-service is F prior to addition of Project traffic. Project traffic is anticipated to worsen level-of-service.

Abatement: Adjust signal splits.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: Project is responsible for its fair-share of signal timing adjustment. The CIP includes funding for intersection and safety improvements at “to be determined” locations. The Project may satisfy this requirement through payment of applicable fees under the El Dorado County traffic impact Fee (TIF) program.

Timing: Prior to issuance of 1st building permit.

5A. Latrobe Road/Town Center Boulevard in 2023

Deficiency: The southbound left turn queue spills back out of its pocket during the PM peak-hour under existing conditions prior to the addition of Project traffic. Project traffic is anticipated to worsen the southbound left turn queue spillback and cause the westbound left turn queue to exceed its pocket length.

Abatement: Adjust signal splits and extend the westbound left-turn pocket from 100 feet to 140 feet.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for its fair share of these intersection improvements. These improvements could be addressed through the line item in the CIP for intersection improvements and the Project would contribute its fair share through payment of the TIF. Because a discrete CIP project is not approved or anticipated for the specific improvement, these intersections improvements were included within the area of potential effect (APE) for the Project.

Timing: Prior to issuance of 1st building permit.

6A. Latrobe Road/White Rock Road in 2023

Deficiency: The westbound left-turn queue spills back out of its turn pocket under existing conditions without the Project. Project traffic is anticipated to worsen that queue spillback.

Abatement: Adjust signal splits.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: This abatement partially implements Project #36105069 in the 20-year Capital Improvement Program (CIP). The Project is responsible for its fair share of modification of signal timing, which may be addressed through payment of fees if the CIP project is moved to the 10-year CIP.

Timing: Prior to issuance of 1st building permit.

8A. Latrobe Road/Suncast Lane in 2023

Deficiency: The eastbound left turn queue spills-back out of its pocket during the PM peak-hour under existing conditions prior to the addition of Project traffic. Project traffic is anticipated to worsen the existing deficiency.

Abatement: Restripe the eastbound approach to have a left and a shared left-right lane.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: Project is responsible for its fair-share of restriping. The CIP includes funding for intersection and safety improvements at "to be determined" locations. The Project may satisfy this requirement through payment of applicable fees under the El Dorado County traffic impact Fee (TIF) program.

Timing: Prior to issuance of 1st building permit.

9A. Latrobe Road/ Golden Foothill Parkway (south) in 2023

Deficiency: Project traffic is anticipated to create a new intersection level-of-service deficiency during the PM peak-hour, and worsen existing queue spillback from the eastbound left turn during both the AM and PM peak-hours.

Abatement: Stripe eastbound approach as 2-lanes between Robert J. Mathewsws Pkwy and Latrobe Rd and widen to three lanes at the intersection by constructing a 200-foot eastbound right turn pocket. Label the eastbound approach lanes as left, left, thru-right. Adjust cycle length and splits. These improvements are consistent with intersection improvements that would be constructed under Abatement (ii)A ("Latrobe 72") above. Therefore, addition of LATROBE 72 to the 10-year CIP would address the Project's fair share cost of these improvements as well.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for its fair share of the cost of these off-site improvements which would be addressed by payment of fees after Latrobe 72 is added to the 10-year CIP.

Timing: Prior to issuance of 1st building permit.

Cross reference: See abatement 9B, which builds on abatement 9a.

10A. Latrobe Road/Investment Boulevard in 2023

Deficiency: Project traffic is anticipated to cause the northeast bound (Investment Blvd) left turn queue to spill out of its left-turn pocket during the AM peak-hour, and worsen existing queue spill back for that same movement during the PM peak-hour.

Abatement: Stripe eastbound approach as left, shared left-right in 180-foot pocket. Adjust cycle length and splits. These improvements are consistent with intersection improvements that would be constructed under Abatement (ii)A ("Latrobe 72") above. Therefore, addition of LATROBE 72 to the 10-year CIP would address the Project's fair share cost of these improvements as well.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for its fair share of the cost of these off-site improvements which would be addressed by payment of fees after Latrobe 72 is added to the 10-year CIP.

Timing: Prior to issuance of 1st building permit.

11A. Latrobe Road/Avanti Drive in 2023

Deficiency: Project traffic is anticipated to cause this intersection to operate at level-of-service F.

Abatement: Construct 100-foot left turn pockets on Latrobe (NB and SB). Construct 100-foot receiving lane on NB Latrobe for EB left turns from Project. This intersection is a Project access point and these improvements can likely be done as part of the Project's frontage improvements.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for construction of these intersection improvements.

Timing: Prior to issuance of 1st building permit.

12A. Latrobe Road/Royal Oaks Drive in 2023

Deficiency: Project traffic is anticipated to worsen the intersection to level-of-service F.

Abatement: Reconstruct the intersection as a signal-controlled intersection. The eastbound approach should be constructed as a three-lane approach with a left-turn lane in a 220-foot pocket, a shared left-thru, and a right turn lane in a 100-foot pocket. This intersection is a Project access point and these improvements can likely be done as part of the Project's frontage improvements.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for construction of these intersection improvements.

Timing: Prior to issuance of 1st building permit.

13A. Golden Foothill Pkwy/Robert J. Mathews Pkwy in 2023

Deficiency: Project traffic is anticipated to worsen existing level-of-service F conditions.

Abatement: Reconstruct as a roundabout. Construct as follows:

- Northbound approach - a shared left-right lane and a right-turn lane in a 100-foot pocket.
- Westbound approach - a left-turn lane and a through lane.
- Eastbound approach – a shared through-right lane.

Figure 13 provides the traffic model's representation of this geometry and its relation to the adjacent intersection of Latrobe Rd/Golden foothill Pkwy (south) with abatement 9A implemented.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for its fair share of the cost of these off-site improvements which would be addressed by payment of fees after the roundabout is added to the 10-year CIP.

Timing: Prior to issuance of 1st building permit.

Figure 13. Golden Foothill Pkwy (south)/Robert J. Mathews Pkwy roundabout 2023 geometry

18A. White Rock Road/Carson Crossing Road in 2023

Deficiency: Project traffic is anticipated to worsen existing level-of-service F conditions and cause the peak-hour signal warrant to be met.

Abatement: Signalize the intersection utilizing existing geometry.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: This off-site improvement partially implements 20-year CIP project 36105041 (White Rock Road Widening 2 to 4 Lanes - Windfield Way to Sacramento County Line) and it should be advanced to the 10-year CIP. The Project is responsible for its fair share of cost, which would be met through payment of the TIF program fee.

Timing: Prior to issuance of 1st building permit.

21A. White Rock Road/Valley View Parkway in 2023

Deficiency: Project traffic is anticipated to worsen level-of-service to F and worsen existing left-turn queue spillback on eastbound and westbound White Rock Rd.

Abatement: Reconstruct White Rock Rd through the intersection as follows:

- Eastbound approach: restripe the left turn pocket to 400-feet, restripe the shared through-right lane as a through lane, construct a right-turn lane in a 220-foot pocket.
- Westbound approach (White Rock Rd): Widen to construct a right-turn lane in a 220-foot pocket and extend the left-turn pocket to 400-feet. Restripe the shared through-right lane as a through lane.

Widening should be done to the south or Latrobe Rd to avoid high voltage lines. Eastbound-westbound Lane alignment may require additional space.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: CIP Project 36105042 (White Rock Road Widening 2 to 4 lanes - Post Street to South of Silva Valley Parkway) includes funding for improvements to this intersection in both the 10-year and 20-year CIPs and all components should be advanced to 10-year CIP. The Project's fair share responsibility for this improvement can be met through payment of TIF program fees.

Timing: Payment of TIF at issuance of each building permit.

Cross reference: See abatement 21B, which builds on abatement 21a.

Table 19. Existing 2023 intersection delay and level-of-service with and without the abated Project

7.0 EPPAP 2033 CONDITIONS

The EPAP 2033 conditions analysis started with lane configurations from Existing 2023 conditions, turning movements derived from existing traffic counts, growth factors from the Travel Demand Model, and the NCHRP 255 adjustment procedure[18].

Several volume and network adjustments were then made.

One Capital Improvement Program (CIP) project that effects study intersection geometry was accounted for:

- CIP Project 36105076: "El Dorado Hills Saratoga Way Turn Pockets" will construct a southbound right turn pocket and extend the northbound and southbound left turn pockets on El Dorado Hills Blvd. The southbound right pocket was modeled as a 300-foot right turn pocket. The northbound and southbound left turn pockets were modeled as 500-foot left turn pockets.

Traffic volumes from 2023 without the Project were used as a floor before traffic from the avoided trips (see **Figure 11**, page 47) was shifted from where the TDM loads it directly onto Carson Crossing Drive to Investment Blvd.

Traffic for the approved Carson Creek/Heritage Project was added. Note that because the Creekside Village project also has avoided R&D and industrial vehicle trips, some turning movements are lower in 2033 than they were in 2023.

Figure *14* summarizes the turning movements and lane configurations for the EPPAP 2033 conditions scenario.

Delay and level-of-service is presented in **Table 20** through **Table 22**. Intersection control is listed as signal, two-way stop-controlled (TWSC), or all-way stop-control (AWSC). Both the estimated delay and level-of-service (LOS) is provided. At TWSC intersections, the movement with the worst delay is shown in parentheses. Ninety-fifth percentile left turn queues are also listed. Entries shown in **bold black** typeface denote deficient traffic operations, and unsignalized intersections that meet the peak hour signal warrant are denoted with an asterisk and shading.

The results indicate that one study segment (White Rock Rd between Valley View Pkwy to Silva Valley Pkwy) and sixteen study intersections operate deficiency with level-of-service F conditions and/or 95% left turn queues that exceed available storage lengths.

Notes:
Density in units of passenger cars per mile per lane.
*Prior to the opening of the Saratoga Way extension, Caltrans has reported occasional LOS F conditions during the morning peak for this segment based on planning methods rather than counts.

Table 22. EPAP 2033 arterial level-of-service check without the Project

Arterial Segment	Description	2033 AM No Project	2033 PM No Project
Latrobe Rd between Royal Oaks Dr and Investment Blvd	2-lane arterial (threshold 1650)	736	734
Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south)	2-lane arterial (threshold 1650)	1213	1035
Latrobe Rd between Golden Foothill Pkwy (south) and Suncast Ln	4-lane divided arterial (threshold 3290)	2756	2549
Latrobe Rd between White Rock Rd and Town Center Blvd	8-lane divided arterial (threshold 6280, extrapolated from 6-lane divided arterial)	3327	3354
White Rock Rd between Valley View Pkwy to Silva Valley Pkwy	2-lane arterial (threshold 1650)	**1856**	**2360**

(This page intentionally left blank)

8.0 EPAP 2033 PLUS PROPOSED PROJECT CONDITIONS

8.1 Traffic Volumes

Peak hour Project trips (**Figure 8** page 40) and avoided R&D and industrial trips (**Figure 11** page 47) were added to the EPAP 2033 conditions traffic volumes. Delay and level-of-service were determined at the study intersections and segments. **Figure 15** summarizes the turning movements and lane configurations for the EPPAP 2033 Plus Proposed Project scenario.

8.2 Level-of-Service

Table 23 through **Table 25** present a summary of the level-of-service results for the study intersections and segments under EPAP 2033 Plus Proposed Project conditions. Intersection control is listed as signal, two-way stop-controlled (TWSC), or all-way stop-control (AWSC). Both the estimated delay and level-of-service (LOS) is provided. At TWSC intersections, the movement with the worst delay is shown in parentheses. Ninety-fifth percentile left turn queues are also listed. Entries shown in **Bold black** text in **Table 23** through **Table 25** denote locations with preexisting deficiencies that the Project is not anticipated to worsen. **Bold red** text denotes locations where the Project is anticipated to create new or worsen preexisting deficiencies. Unsignalized intersections that meet the peak hour signal warrant are shaded and denoted with an asterisk.

Two arterial segments are anticipated to have a preexisting deficiency worsened by Project traffic or a new deficiency caused by Project traffic. Eighteen intersections are anticipated to have level-of-service and/or queue spillback deficiencies.

<u>2 Arterial segments with worsened or new Project related deficiencies:</u>

- White Rock Rd between Valley View Pkwy to Silva Valley Pkwy AM and PM; and
- Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south) PM.

<u>6 Locations that are deficient with or without the Project that are not worsened:</u>

- (1) El Dorado Hills Blvd/Serrano Pkwy AM;
- (8) Latrobe Rd/Suncast Ln AM and PM;
- (14) Investment Boulevard/Robert J. Mathews Pkwy AM;
- (19) White Rock Road/Windfield Way AM and PM;
- (20) White Rock Road/Post Street AM and PM; and
- (23) Silva Valley Parkway/US 50 EB ramps AM.

<u>10 Locations that are deficient with or without the Project that are worsened:</u>

- (2) El Dorado Hills Blvd/Saratoga Way AM and PM;
- (3) El Dorado Hills Blvd/US 50 WB AM and PM;
- (5) Latrobe Road/Town Center Boulevard PM;
- (6) Latrobe Road/White Rock Road AM and PM;
- (7) Latrobe Road/Golden Foothill Parkway (N) AM and PM;
- (9) Latrobe Road/ Golden Foothill Parkway (S) AM and PM;

- (10) Latrobe Road/Investment Boulevard AM and PM;
- (13) Golden Foothill Parkway (S)/Robert J. Mathewsws Pkwy AM and PM;
- (18) White Rock Road/Carson Crossing Road PM; and
- (21) White Rock Road/Valley View Parkway: AM and PM.

<u>2 Locations where the Project is anticipated to cause new deficiencies:</u>

- (11) Latrobe Road/Avanti Drive AM and PM; and
- (12) Latrobe Road/Royal Oaks Drive AM and PM.

Calculation sheets for delay and level-of-service are provided in **Appendix B**. the remainder of the study intersections, all of the US 50 study segments, and arterial study segments were found to operate acceptably.

8.3 Existing 2033 Plus Project General Plan Deficiency Findings

Level-of-service and queueing impacts are not considered significant under CEQA. Intersections and/or segments where Project traffic creates new or worsens existing exceedances of General Plan policy thresholds are referred to as having a "project deficiency". There are twelve intersections and two arterial segments where the Project is anticipated to create new or worsen existing deficiencies under EPAP 2033 conditions.

There are two sections that follow describing the segment level abatement measures and intersection level abatement measures. Throughout this document, segment deficiencies are numbered using the segment number (i through v) and a year code (2023 = "A", 2033 = "B", and 2040 = "C"). Intersection abatement measures are numbered using the intersection number (1-27) and the year code (A, B, or C).

All deficiencies and abatements described below include the deficiency number/abatement number and location as a title, followed by a description of the deficiency, the abatement, findings, responsibility, and timing. For certain abatements, a building permit trigger has been analyzed and included to determine the necessary timing for the improvement. For all other abatements, it is assumed the timing would be prior to issuance of the first building permit. If desired, a building permit trigger could also be determined for those abatements.

2033 Segment Deficiencies and Abatement Measures

(ii)B. Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south) in 2033 (CIP Project Latrobe 72)

Deficiency: Level-of-service is anticipated to worsen to F with the addition of Project traffic during the AM and PM peak-hours.

Abatement: Implement as abatement (ii)A.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 26** presents the segment level-of-service results with this abatement.

Project responsibility: None, addressed through abatement (ii)A.

Timing: Not applicable, addressed through abatement (ii)A.

(v)B. White Rock Rd between Valley View Pkwy to Silva Valley Pkwy in 2033

Deficiency: This segment operates at level-of-service F under EPAP 2033 conditions without the Project and the Project is anticipated to add more than 10 peak hour trips to this segment, worsening the existing level-of-service deficiency.

Abatement: Before issuance of the 173rd residential building permit or the first commercial building permit, advance CIP Project 36105042 to the 10-year CIP (widen White Rock Rd to four lanes between Valley View Pkwy and Silva Valley Pkwy.).

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 26** presents the segment level-of-service results with this abatement.

Project Responsibility: CIP Project 36105042 (White Rock Road Widening 2 to 4 lanes - Post Street to South of Silva Valley Parkway) includes funding for improvements to this segment in both the 10-year and 20-year CIPs and all components should be advanced to 10-year CIP. The Project's fair share responsibility for this improvement can be met through payment of TIF program fees.

Timing: Prior to issuance of the 173rd residential building permit or the first commercial building permit.

Table 26. EPAP 2033 arterial level-of-service check with and without the abated Project

Arterial Segment	Description	2033 AM No Project	2033 PM No Project	2033 AM Plus Project	2033 PM Plus Project
Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south)	**Un Abated** 2-lane arterial (threshold 1650)	1213	1035	**1891**	**1781**
	Limit Project to 658 dwelling units: 2-lane arterial (threshold 1650)	1213	1035	1606	1534
	Add Widening to CIP: 4-lane divided arterial (threshold 3290)	1213	1035	1891	1781
White Rock Rd between Valley View Pkwy to Silva Valley Pkwy	**Un Abated** 2-lane arterial (threshold 1650)	**1856**	**2360**	**1910**	**2417**
	Limit Project to 172 dwelling units: 2-lane arterial (threshold 1650)	**1856**	**2360**	**1864.19**	**2369.96**
	Add Widening to CIP: 4-lane divided arterial (threshold 3290)	1213	1035	1891	1781

2033 Intersection Deficiencies and Abatement Measures

2B. El Dorado Hills Blvd/Saratoga Way in 2033

Deficiency: Level-of-service is F prior to addition of Project traffic, with northbound left-turn queues spilling out of the turn pocket. Project traffic is anticipated to worsen level-of-service and northbound left-turn queues.

2023-2033 Improvements Assumed: Southbound right-turn pocket (300-foot) and 500-foot northbound and southbound left turn pockets are assumed as part of CIP project 36105076.

Abatement: In addition to abatement 2A, prohibit northbound U-turns, overlap the eastbound right turn with the northbound left turn, and overlap the southbound right turn with the eastbound left turn.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project Responsibility: This abatement partially implements Project #36105076 in the 10-year Capital Improvement Program (CIP). The Project may satisfy its fair share of this requirement through payment of applicable fees under the El Dorado County traffic impact Fee (TIF) program.

Timing: Prior to issuance of 1st building permit.

Cross reference: See abatement 2A.

3B. El Dorado Hills Blvd/US 50 WB in 2033

Deficiency: AM peak-hour level-of-service is F prior to addition of Project traffic. Project traffic is anticipated to worsen level-of-service.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 3A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 3A.

Timing: Not applicable, addressed through abatement 3A.

4B. El Dorado Hills Blvd/US 50 EB in 2033

Deficiency: PM peak-hour 95th percentile queue on ramp is anticipated to reach 1251-feet, ending with 500-feet of the gore-point (where the ramp exits the freeway). Project traffic is anticipated to add 172-feet to the queue. This is a potentially traffic operations issue as the 2 lane portion of the ramp is limited to 430-feet.

2023-2033 Improvements Assumed: None.

Abatement: construct a 3rd eastbound right turn lane from the offramp to southbound Latrobe Road. The new turn lane shall match the approximate length of the existing 2-lane portion of the offramp.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: While this deficiency will occur with or without the Project, the Project is responsible for its fair share of the cost of this off-site improvement, which can be addressed through payment of fees after widening of the eastbound diagonal offramp has been added to 10-year CIP. Note that CIP Project 36104001 (US 50 / Latrobe Road/ El Dorado Hills Boulevard Interchange Improvements Phase 2B) includes reconstruction of the EB diagonal on-ramp, EB on-ramp auxiliary lane, and the EB loop off-ramp. That CIP project could potential address this eastbound offramp widening as well or be done as an independent CIP project.

Timing: Payment of TIF at issuance of each building permit.

Cross reference: See abatement 4C.

5B. Latrobe Road/Town Center Boulevard in 2033

Deficiency: The southbound left-turn queue spills back out of its pocket during the PM peak-hour prior to the addition of Project traffic. Project traffic is anticipated to worsen the southbound left-turn queue spillback and cause the westbound left-turn queue to exceed its pocket length.

2023-2033 Improvements Assumed: None.

Abatement: implement as abatement 5A.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 5A.

Timing: Not applicable, addressed through abatement 5A.

6B. Latrobe Road/White Rock Road in 2033

Deficiency: The westbound left-turn queue spills back out of its turn pocket. Project traffic is anticipated to worsen that queue spillback.

2023-2033 Improvements Assumed: None.

2023-2033 Improvements Assumed: None.

Abatement: implement as abatement 6A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 6A.

Timing: Not applicable, addressed through abatement 6A.

7B. Latrobe Road/Golden Foothill Parkway (N) in 2033

Deficiency: Project traffic is anticipated to worsen level-of-service to F.

2023-2033 Improvements Assumed: None.

Abatement: Construct 180-foot southbound right turn pocket.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: CIP 36105069 will widen this portion of Latrobe Rd to six lanes by 2040 and should be advanced to the 10-year CIP. The Project's fair share cost of this improvement is payment of the TIF program fee.

Timing: Prior to issuance of 1st building permit.

9B. Latrobe Road/ Golden Foothill Parkway (S) in 2033

Deficiency: Project traffic is anticipated to worsen the intersection to level-of-service F conditions.

2023-2033 Improvements Assumed: None.

Abatement: Abatement 9B is similar, but expands upon, abatement 9A:

- Eastbound approach: Implement abatement 9A.
- Westbound approach: Stripe westbound approach to 2-lanes between Blackstone Pkwy and Latrobe Rd, and construct a 250' right left pocket. Label the resulting three lanes as left, left, thru-right.
- Northbound approach: Widen northbound approach by constructing an additional 100' right turn pocket and extending the left turn pocket to 260'. Label the resulting four lanes as left, thru, thru, and right.
- Southbound approach: Widen southbound approach by constructing an additional 300' right turn pocket, label the resulting four lanes as left, thru, thru, right.

Figure 16 below shows the traffic model's representation of these improvements. Note that the depicted northbound right turn lane was drawn with a 24-foot width to reflect the assumed ultimate width of Latrobe Rd after widening to four lanes with the "Latrobe 72" improvements and an additional northbound through lane. The Project is not obligated to build improvements to that footprint, but it is advised that any relocation of traffic signals be placed outside of the intersection's ultimate footprint.

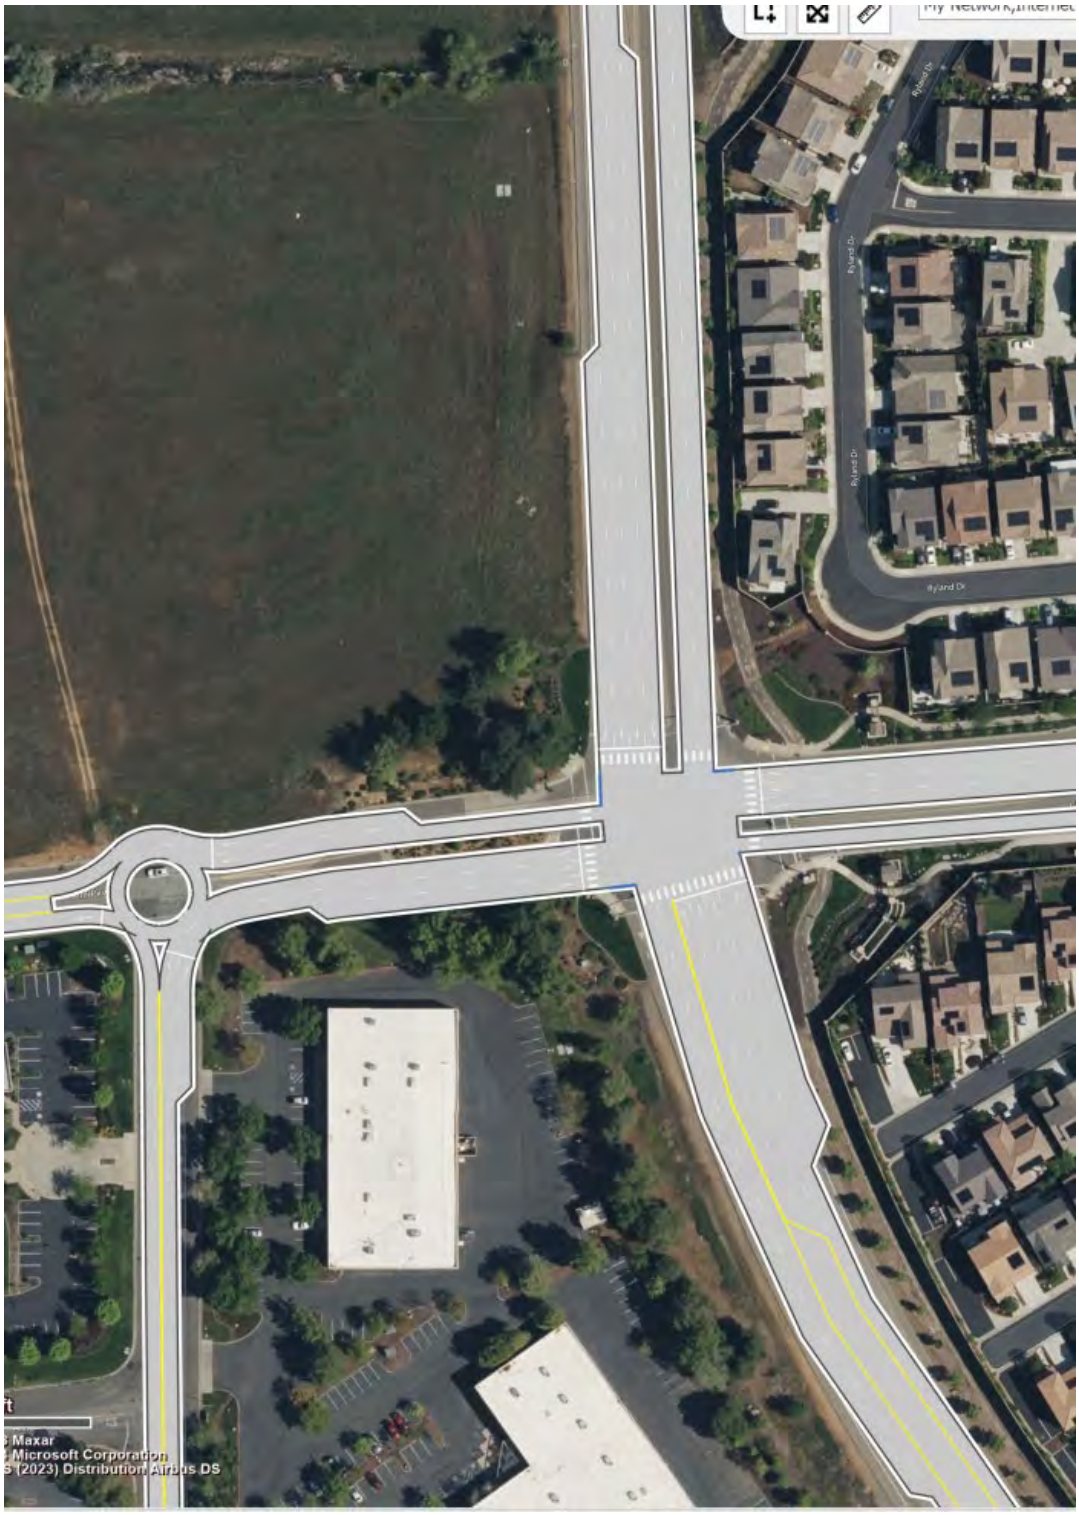

Figure 16. Latrobe Rd/Golden Foothill Pkwy (south) 2033 geometry with adjacent roundabout at Golden Foothill Pkwy/Robert J. Mathews Pkwy.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for its fair share of the cost of these off-site improvements which would be addressed by payment of fees after Latrobe 72 is added to the 10-year CIP.

Timing: Prior to issuance of 1st building permit.

Cross reference: See abatement 9A.

10B. Latrobe Road/Investment Boulevard in 2033

Deficiency: Project traffic is anticipated to cause the eastbound (Investment Blvd) left-turn queue to spill out of its left-turn pocket.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 10A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 10A.

Timing: Not applicable, addressed through abatement 10A.

11B. Latrobe Road/Avanti Drive in 2033

Deficiency: Project traffic is anticipated to cause this intersection to operate at level-of-service F.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 11A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 11A.

Timing: Not applicable, addressed through abatement 11A.

12B. Latrobe Road/Royal Oaks Drive in 2033

Deficiency: Project traffic is anticipated to worsen the intersection to level-of-service F.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 12A.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 12A.

Timing: Not applicable, addressed through abatement 12A.

13B. Golden Foothill Pkwy/Robert J. Mathews Pkwy in 2033

Deficiency: The Project is anticipated to worsen existing level-of-service F conditions at this intersection.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 13A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 13A.

Timing: Not applicable, addressed through abatement 13A.

18B. White Rock Road/Carson Crossing Road in 2033

Deficiency: Project traffic is anticipated to cause new and worsen level-of-service F conditions. The peak-hour signal warrant is met with or without the Project.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 18A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this

location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 18A.

Timing: Not applicable, addressed through abatement 18A.

21B. White Rock Road/Valley View Parkway in 2033

Deficiency: Project traffic is anticipated to worsen level-of-service to F conditions and worsen left-turn queue spillback on eastbound and westbound White Rock Rd.

2023-2033 Improvements Assumed: None.

Abatement: Reconstruct White Rock Rd through the intersection as follows:

- Implement abatement 21 A.
- Further extend the westbound left turn pocket to 1000 feet. (note: abatement 21A will extend this pocket to 400 feet, abatement 21B reflects an additional 600 feet of westbound right turn storage.)

Widening should be done to the south of Latrobe Rd to avoid high voltage lines. Eastbound-westbound Lane alignment may require additional space.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: CIP Project 36105042 (White Rock Road Widening 2 to 4 lanes – Post Street to South of Silva Valley Parkway) includes funding for improvements to this intersection in both the 10-year and 20-year CIPs and all components should be advanced to 10-year CIP. The Project's fair share responsibility for this improvement can be met through payment of TIF program fees.

Timing: Prior to issuance of 1st building permit.

Table 27. EPAP 2033 intersection delay and level-of-service with and without the abated Project

ID	Intersection	Control	Left Turn Storage	2033 AM Peak No Project			2033 PM Peak No Project			2033 AM Peak with Project			2033 PM Peak with Project			Abatement Strategy	Left Turn Storage	Abated AM Peak (+ Proj)			Abated PM Peak (+ Proj)			Existing or Anticipated CIP Project

9.0 CUMULATIVE 2040 CONDITIONS

The Cumulative 2040 conditions analysis started with lane configurations from Existing 2020 conditions and turning movements derived from existing traffic counts, growth factors from the Travel Demand Model, and the NCHRP 255 adjustment procedure. Several volume and network adjustments were then made.

Seven Capital Improvement Program (CIP) projects that effect study intersection geometry were accounted for:

- CIP Project 36105042: Widening of White Rock Road to four-lanes between Post Street and the US 50 Silva Valley interchange.
- CIP Project 36105007: Country Club Drive Extension to El Dorado Hills Blvd.
- CIP Project 36105035: Saratoga Way Extension Phase 2 (widening to 4-lanes and associated intersection improvements).
- CIP Project 36104021: US 50 auxiliary lane westbound - El Dorado Hills Blvd to El Dorado County line.
- CIP Project 36104001: US 50/El Dorado Hills Blvd interchange improvements phase 2B (adds another NB through lane at study intersection #4.
- CIP Project 36104004: US 50/Silva Valley Parkway interchange Phase 2 – on ramps and auxiliary lanes. (adds eastbound slip onramp and westbound loop onramp).
- CIP Project 36105041: White Rock Road widening to four-lanes between Manchester Drive and the El Dorado County Line.

Traffic volumes from 2033 without the Project were used as a floor before traffic from the avoided trips (see **Figure 10**, page 44) was shifted from where the TDM loads it directly onto Carson Crossing Drive to Investment Blvd. Traffic for the approved Carson Creek/Heritage project was added. Note that because the Creekside Village project also has avoided R&D and industrial vehicle trips, some turning movements are lower in 2040 than they were in 2033. For 2040, a peak hour factor of 0.92 was also used as a floor.

Figure *17* summarizes the turning movements and lane configurations for the Cumulative 2040 conditions scenario.

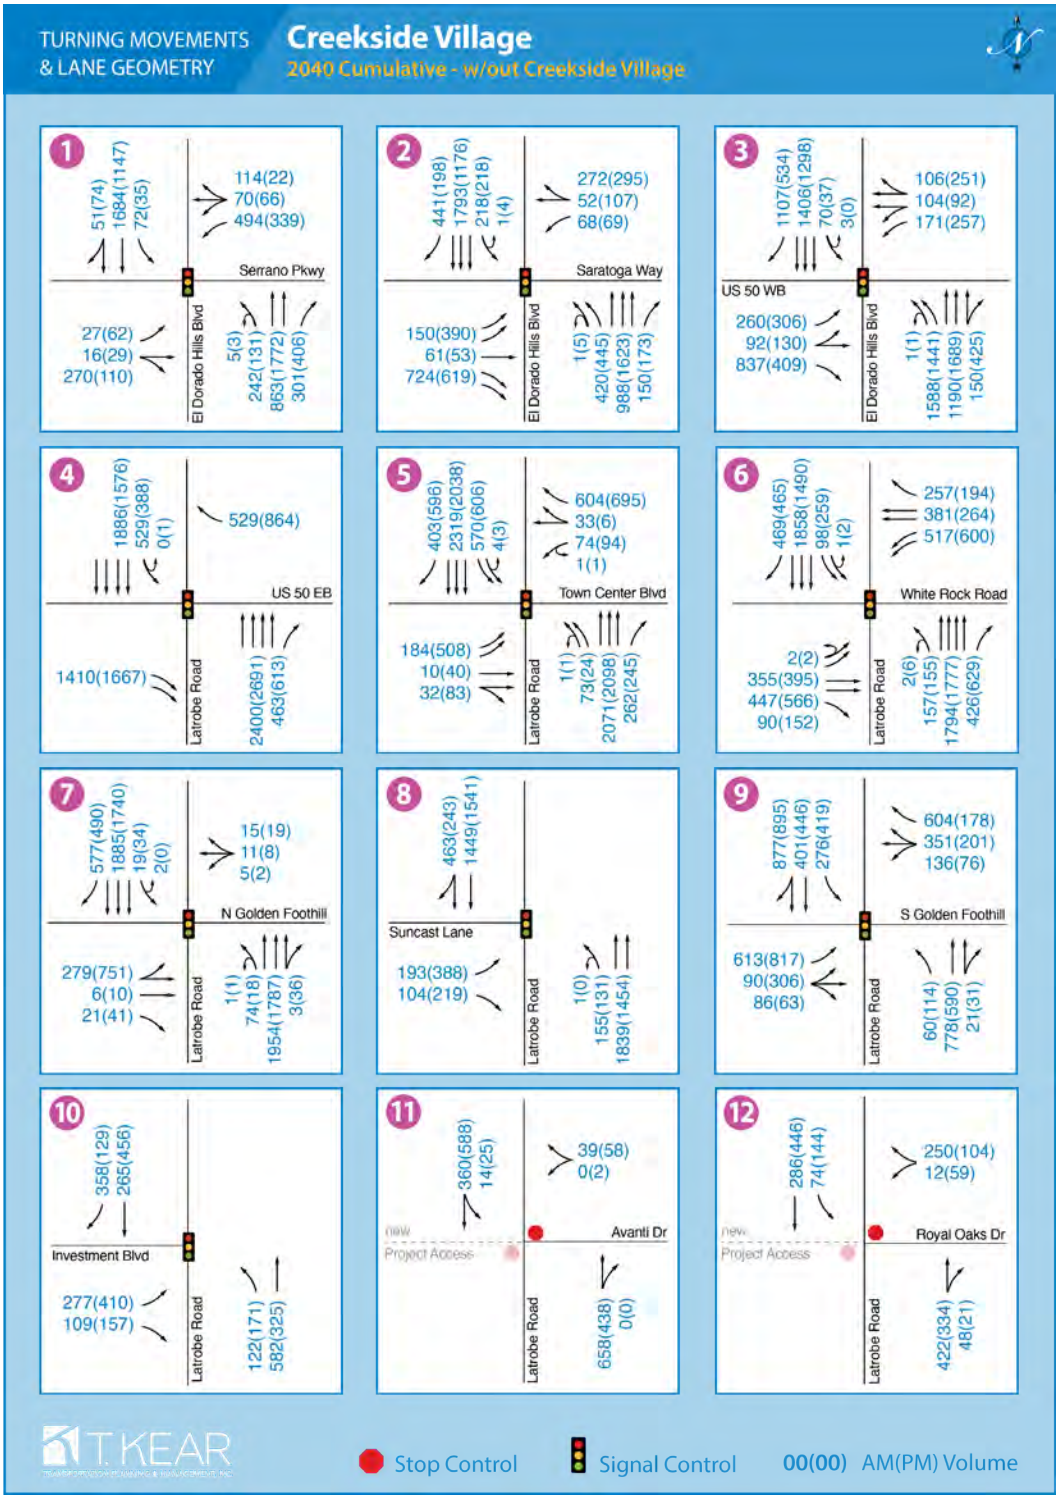

Figure 17. Cumulative 2040 lane geometry and turning movements

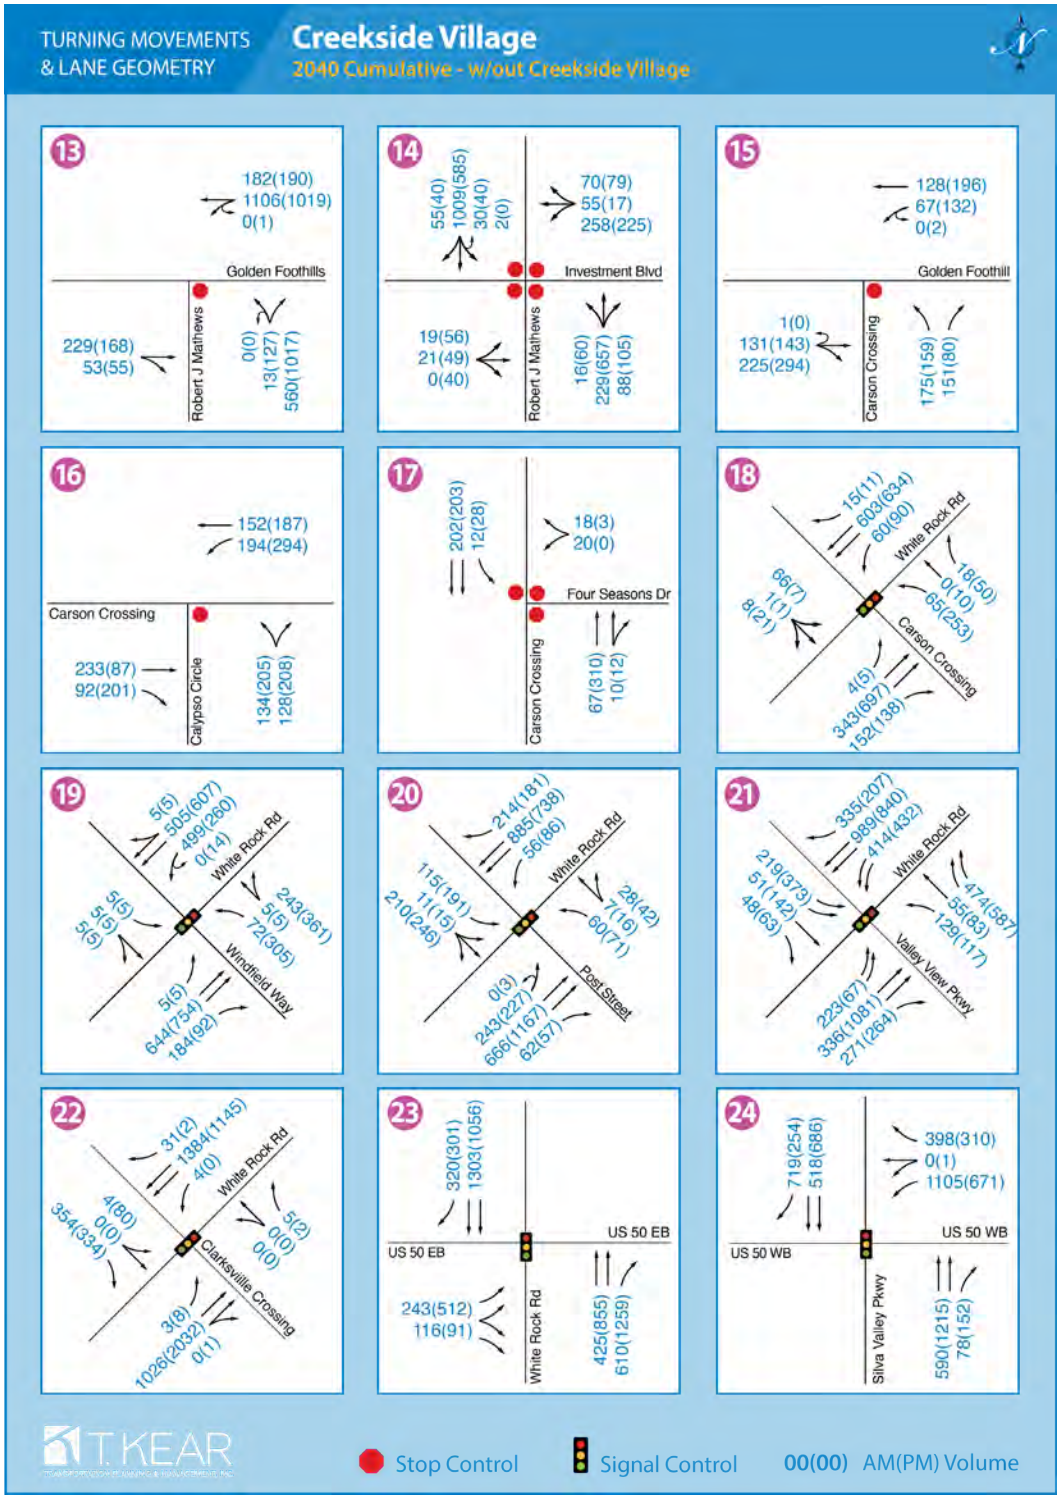

Figure 17. Cumulative 2040 lane geometry and turning movements (continued)

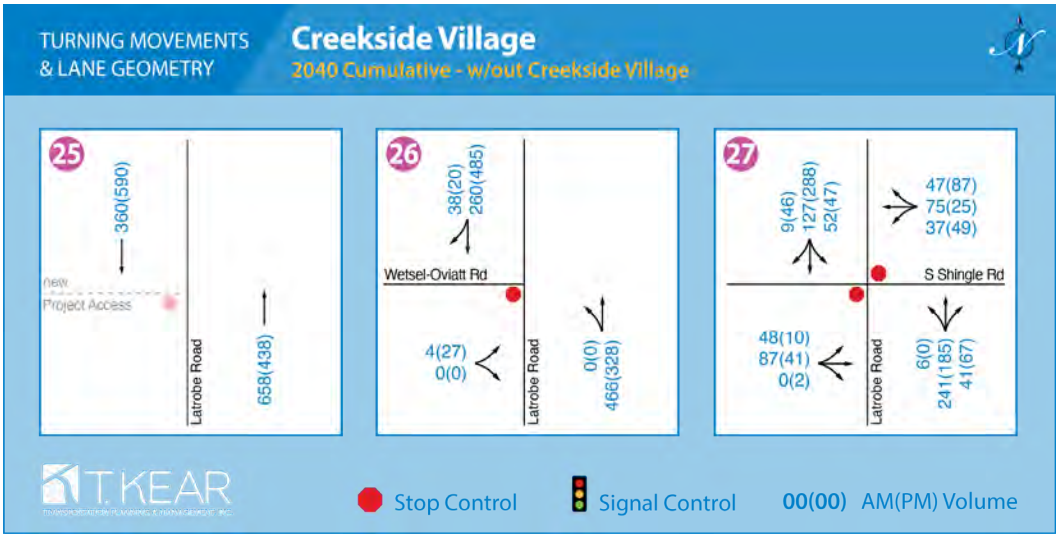

Figure *17*. Cumulative 2040 lane geometry and turning movements (continued)

Delay and level-of-service is presented in **Table 28** through **Table 30**. Intersection control is listed as signal, two-way stop-controlled (TWSC), or all-way stop-control (AWSC). Both the estimated delay and level-of-service (LOS) is provided. At TWSC intersections, the movement with the worst delay is shown in parentheses. Ninety-fifth percentile left turn queues are also listed. Entries shown in **bold black** typeface denote deficient traffic operations, and unsignalized intersections that meet the peak hour signal warrant are denoted with an asterisk and shading.

The results indicate that thirteen study intersections operate deficiency with level-of-service F conditions and/or 95% left turn queues that exceed available storage lengths.

- (1) El Dorado Hills Blvd/Serrano Pkwy AM;
- (2) El Dorado Hills Blvd/Saratoga Way PM;
- (3) El Dorado Hills Blvd/US 50 WB AM and PM;
- (5) Latrobe Road/Town Center Boulevard AM and PM;
- (8) Latrobe Rd/Suncast Ln AM and PM;
- (9) Latrobe Road/ Golden Foothill Parkway (S) AM and PM;
- (10) Latrobe Road/Investment Boulevard PM;
- (13) Golden Foothill Parkway (S)/Robert J. Mathewsws Pkwy AM and PM;
- (14) Investment Boulevard/Robert J. Mathews Pkwy AM and PM
- (16) Carson Crossing Road/Calypso Circle PM;
- (19) White Rock Road/Windfield Way AM and PM;
- (20) White Rock Road/Post Street AM and PM; and
- (21) White Rock Road/Valley View Parkway PM.

Calculation sheets for delay and level-of-service are provided in **Appendix B**. the remainder of the study intersections, all of the US 50 study segments, and arterial study segments were found to operate acceptably.

Table 30. Cumulative 2040 arterial level-of-service check without the Project

Arterial Segment	Description	2040 AM No Project	2040 PM No Project
Latrobe Rd between Royal Oaks Dr and Investment Blvd	2-lane arterial (threshold 1650)	775	809
Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south)	2-lane arterial (threshold 1650)	1303	1073
Latrobe Rd between Golden Foothill Pkwy (south) and Suncast Ln	4-lane divided arterial (threshold 3290)	3134	2776
Latrobe Rd between White Rock Rd and Town Center Blvd	8-lane divided arterial (threshold 6280, extrapolated from 6-lane divided arterial)	3598	3580
White Rock Rd between Valley View Pkwy to Silva Valley Pkwy	4-lane divided arterial (threshold 3290)	2303	2934

(This page intentionally left blank)

10.0 CUMULATIVE 2040 PLUS PROPOSED PROJECT CONDITIONS

10.1 Traffic Volumes

Peak hour Project trips (**Figure 8** page 40) and avoided R&D and industrial trips (**Figure 10** page 44) were added to the EPPAP 2040 conditions traffic volumes. Delay and level-of-service were determined at the study intersections and segments. **Figure 18** summarizes the turning movements and lane configurations for the Cumulative 2040 Plus Proposed Project scenario.

10.2 Level-of-Service

Table 31 through **Table 33** present a summary of the level-of-service results for the study intersections and segments under Cumulative 2040 Plus Proposed Project conditions. Intersection control is listed as signal, two-way stop-controlled (TWSC), or all-way stop-control (AWSC). Both the estimated delay and level-of-service (LOS) is provided. At TWSC intersections, the movement with the worst delay is shown in parentheses. Ninety-fifth percentile left turn queues are also listed. Entries shown in **Bold black** text in **Table 31** through **Table 33** denote locations with preexisting deficiencies that the Project is not anticipated to worsen. **Bold red** text denotes locations where the Project is anticipated to create new or worsen preexisting deficiencies. Unsignalized intersections that meet the peak hour signal warrant are shaded and denoted with an asterisk.

One arterial segment is anticipated to have new deficiency caused by Project traffic (Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south). Fifteen intersections are anticipated to have level-of-service and/or queue spillback deficiencies.

<u>9 Locations that are deficient with or without the Project that are not worsened:</u>

- (1) El Dorado Hills Blvd/Serrano Pkwy AM;
- (2) El Dorado Hills Blvd/Saratoga Way PM;
- (8) Latrobe Rd/Suncast Ln AM and PM;
- (13) Golden Foothill Parkway (S)/Robert J. Mathewsws Pkwy AM and PM;
- (14) Investment Boulevard/Robert J. Mathews Pkwy AM;
- (16) Carson Crossing Road/Calypso Circle PM;
- (19) White Rock Road/Windfield Way AM and PM;
- (20) White Rock Road/Post Street AM and PM; and
- (21) White Rock Road/Valley View Parkway PM.

<u>4 Locations that are deficient with or without the Project that are worsened:</u>

- (3) El Dorado Hills Blvd/US 50 WB AM and PM;
- (5) Latrobe Road/Town Center Boulevard PM;
- (9) Latrobe Road/ Golden Foothill Parkway (S) AM and PM;
- (10) Latrobe Road/Investment Boulevard AM and PM;

2 Locations where the Project is anticipated to cause new deficiencies:

- (11) Latrobe Road/Avanti Drive AM and PM; and
- (12) Latrobe Road/Royal Oaks Drive AM and PM.

Calculation sheets for delay and level-of-service are provided in **Appendix B**. the remainder of the study intersections, all of the US 50 study segments, and arterial study segments were found to operate acceptably.

Density in units of passenger cars per mile per lane.

*Prior to the opening of the Saratoga Way extension, Caltrans has reported occasional LOS F conditions during the morning peak for this segment based on planning methods rather than counts.

Project plus forgone business park trips will reduce WB US 50 volume between Bass Lake Rd and Latrobe Rd in the morning, and between Latrobe Rd and the El Dorado County Line during the afternoon.

Project plus forgone business park trips will reduce EB US 50 volume between EDC line and Latrobe Rd during the AM-peak, and between Silva Valley Pkwy and Bass Lake Rd during the PM peak.

Table 33. Cumulative 2040 arterial level-of-service check with and without the Project

Arterial Segment	Description	2040 AM No Project	2040 PM No Project	2040 AM Plus Project	2040 PM Plus Project
Latrobe Rd between Royal Oaks Dr and Investment Blvd	2-lane arterial (threshold 1650)	775	809	1510	1606
Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south)	2-lane arterial (threshold 1650)	1303	1073	**1901**	**1751**
Latrobe Rd between Golden Foothill Pkwy (south) and Suncast Ln	4-lane divided arterial (threshold 3290)	3134	2776	3284	3017
Latrobe Rd between White Rock Rd and Town Center Blvd	8-lane divided arterial (threshold 6280, extrapolated from 6-lane divided arterial)	3598	3580	4284	4563
White Rock Rd between Valley View Pkwy to Silva Valley Pkwy	4-lane divided arterial (threshold 3290)	2303	2934	2313	2941

10.3 Findings of Project General Plan Level-of-Service and Queueing Deficiencies

Level-of-service and queueing impacts are not considered significant under CEQA. Intersections and/or segments where Project traffic creates new or worsens existing exceedances of General Plan policy thresholds are referred to as having a "Project deficiency". There are twelve intersections and two arterial segments where the Project is anticipated to create new or worsen existing deficiencies under EPAP 2033 conditions.

There are two sections that follow describing the segment level abatement measures and intersection level abatement measures. Throughout this document, segment deficiencies are numbered using the segment number (i through v) and a year code (2023 = "A", 2033 = "B", and 2040 = "C"). Intersection abatement measures are numbered using the intersection number (1-27) and the year code (A, B, or C).

All deficiencies and abatements described below include the deficiency number/abetment number and location as a title, followed by a description of the deficiency, the abatement, findings, responsibility, and timing. For certain abatements, a building permit trigger has been analyzed and included to determine the necessary timing for the improvement. For all other abatements, it is assumed the timing would be prior to issuance of the first building permit. If desired, a building permit trigger could also be determined for those abatements.

2040 Segment Deficiencies and Abatement Measures

(ii)C. Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south) in 2040 (CIP Project Latrobe 72)

Deficiency: Level-of-service is anticipated to worsen to F with the addition of Project traffic during the AM and PM peak-hours.

Abatement: Implement as abatement (ii)A.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 34** presents the segment level-of-service results with this abatement.

Project responsibility: None, addressed through abatement (ii)A.

Timing: Not applicable, addressed through abatement (ii)A.

Table 34. EPAP 2033 arterial level-of-service check with and without the abated Project

Arterial Segment	Description	2033 AM No Project	2033 PM No Project	2033 AM Plus Project	2033 PM Plus Project
Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south)	**Un Abated** 2-lane arterial (threshold 1650)	1303	1073	**1901**	**1751**
	Limit Project to 658 dwelling units: 2-lane arterial (threshold 1650)	1303	1073	1649.9	1526.4
	Add Widening to CIP: 4-lane divided arterial (threshold 3290)	1303	1073	1901	1751

2040 Intersection Deficiencies and Abatement Measures

3C. El Dorado Hills Blvd/US 50 WB in 2040

Deficiency: AM peak-hour level-of-service is F prior to addition of Project traffic. Project traffic is anticipated to worsen level-of-service.

2023-2040 Improvements Assumed: 2023 CIP 36104001.

Abatement: Implement as abatement 3A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 3A.

Timing: Not applicable, addressed through abatement 3A.

4C. El Dorado Hills Blvd/US 50 EB in 2040

Deficiency: PM peak-hour 95th percentile queue on ramp is anticipated to reach 1400-feet, ending with 500-feet of the gore-point (where the ramp exits the freeway). Project traffic is anticipated to add 124-feet to the queue. This is a potentially traffic operations issue as the 2-lane portion of the ramp is limited to 430-feet.

2023-2040 Improvements Assumed: 2023 CIP 36104001.

Abatement: Implement as abatement 4B

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 4B.

Timing: Not applicable, addressed through abatement 4B.

5C. Latrobe Road/Town Center Boulevard in 2040

Deficiency: The southbound left-turn queue spills back out of its pocket during the PM peak-hour prior to the addition of Project traffic. Project traffic is anticipated to worsen the southbound left-turn queue spillback and cause the westbound left-turn queue to exceed its pocket length.

2023-2040 Improvements Assumed: None.

Abatement: Implement as abatement 5A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 5A.

Timing: Not applicable, addressed through abatement 5A.

9C. Latrobe Road/ Golden Foothill Parkway (S) in 2040

Deficiency: Project traffic is anticipated to worsen the intersection to level-of-service F conditions.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 9B

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 9B.

Timing: Not applicable, addressed through abatement 9B.

Cross reference: See abatement 9A, 9B.

10C. Latrobe Road/Investment Boulevard in 2040

Deficiency: Project traffic is anticipated to cause the eastbound (Investment Blvd) left-turn queue to spill out of its left-turn pocket.

2023-2040 Improvements Assumed: None.

Abatement: Implement as abatement 10A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 10A.

Timing: Not applicable, addressed through abatement 10A.

11C. Latrobe Road/Avanti Drive in 2040

Deficiency: Project traffic is anticipated to cause this intersection to operate at level-of-service F.

2023-2040 Improvements Assumed: None.

Abatement: Implement as abatement 11A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 11A.

Timing: Not applicable, addressed through abatement 11A.

12C. Latrobe Road/Royal Oaks Drive in 2040

Deficiency: Project traffic is anticipated to worsen the intersection to level-of-service F.

2023-2040 Improvements Assumed: None.

Abatement: Implement as abatement 12A.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 12A.

Timing: Not applicable, addressed through abatement 12A.

Table 35. EPAP 2040 intersection delay and level-of-service with and without the abated Project

11.0 CEQA VMT ANALYSIS

Residential and local serving retail components of the Project are each addressed below based on the methods and thresholds specified in Section 3.4.

11.1 Residential Component

The unincorporated countywide VMT per capita for determining the significance threshold for residential projects, and the Project analysis itself are estimated using the same tools and methodology. For this analysis 2018 baseline model results and 2040 cumulative model results were used to estimate the baseline, 15% reduction threshold adopted by the County in Resolution 141-2020 and incorporated herein by reference, and Project VMT as shown in **Table 36**. The significance threshold determined by this calculation is 17.3 VMT per capita. The residential component of the Project is anticipated to generate 13.6 VMT per capita based on 2018 land use and drop to 13.1 VMT per capita by 2040. CEQA Finding: The residential portion of the Project is anticipated to have a **less-than-significant** impact on VMT.

Table 36. Creekside Village residential VMT analysis

	El Dorado County		Project (Based on TAZ 167)	
	2018	**2040**	**2018**	**2040**
Home based VMT	2,813,221	3,158,464	39,441	45,417
Population	137,989	162,164	2,904	3,478
Trips	616,395	746,555	10,217	12,453
VMT per capita	20.4	19.5	13.6	13.1
VMT threshold with 15% reduction	17.3	n/a	n/a	n/a
Avg. trip length (miles)	4.6	4.2	3.9	3.6

11.2 Local Serving Retail Component

The Project includes 5.4 ksf of neighborhood commercial/local serving retail, which will add coffee and dining opportunities within walking distance of the Project, the neighboring Blackstone and Heritage communities, and vehicles passing by on Latrobe Rd. There is not a clear definition of local serving vs regional serving retail; OPR guidance states that retail projects of 50,000 sqft or larger are generally regional rather than local serving. The proposed retail Project component is well under the OPR threshold and is anticipated to be local serving. Therefore, the retail component of Creekside Village is anticipated to be less-than-significant.

The 1.8 ac/5.4 ksf neighborhood commercial/local serving retail is proposed for potential uses such as convenience stores, coffee shops and professional offices. If built entirely as professional office rather than retail, its anticipated trip generation is under the County's 100 trip per day de minimis threshold for small projects and the VMT impact would remain less-than-significant.

(This page intentionally left blank)

12.0 BICYCLE PEDESTRIAN AND TRANSIT IMPACTS

The Project does not interfere with existing or proposed transit service and has a **less-than-significant** impact on transit.

The Project enhances bicycle and pedestrian access to the El Dorado Hills Business Park (**Figure 19**) and does not interfere with existing or planned bicycle and pedestrian facilities. The Project includes a variety of bike and pedestrian amenities providing connections both within the planned community and externally to the existing bike and pedestrian facilities along Latrobe Road and Royal Oaks Dr:

- The Creekside Village entry road will feature class II bike lanes from its intersection with Latrobe Road.
- The Project features a complete system of paved and unpaved trails located in the open space buffer areas and landscape corridors. The trails will be destination-oriented and link the various residential neighborhoods, parks, and the business park.
- The majority of Creekside Village streets will include attached or separated sidewalks on both sides of the street. Sidewalks will comply with ADA standards and be a minimum of 4-feet in width.

The Project has a **less-than-significant** impact on bicycle and pedestrian facilities.

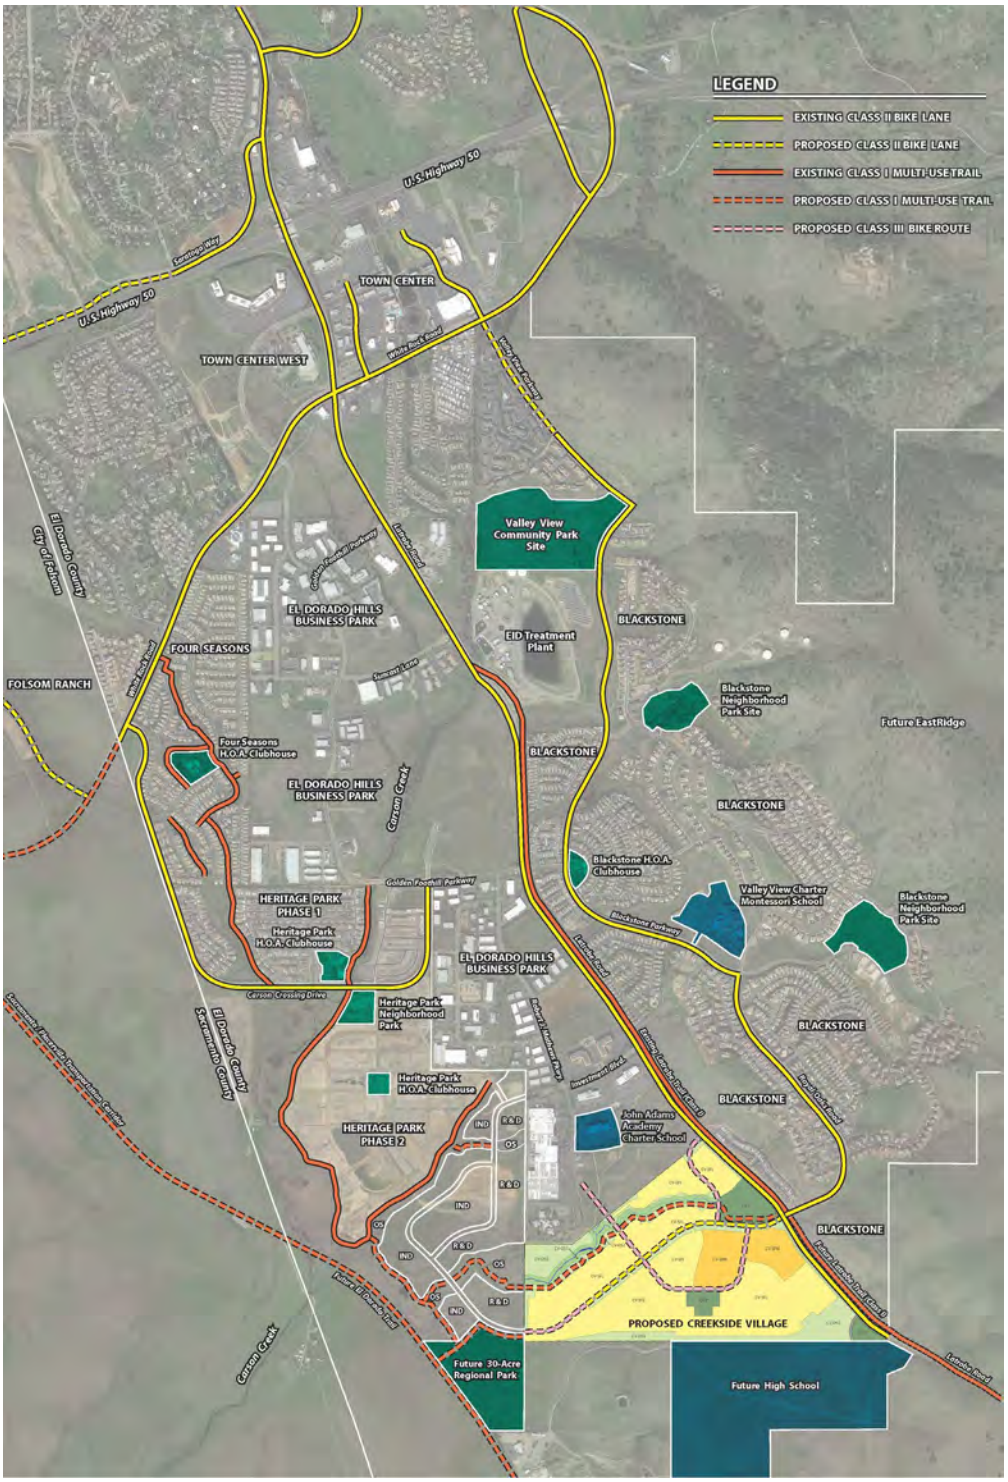

Figure 19. Bike and pedestrian facilities map (Project would construct on-site facilities)

13.0 FINDINGS

13.1 Trip Generation Findings

The 918 dwelling unit Project with 5,400 sqft of neighborhood commercial space is anticipated to generate 834 AM peak hour trips, 955 PM peak hour trips, and 10,040 daily trips. Those trips are largely offset by 2040 through forgone commercial development on the 207.9 ac project site which the travel demand model anticipated would have generated 733 AM peak hour trips, 829 PM peak hour trips, and 9,415 daily trips. Net, the Project therefore adds only 101 AM peak hour trips during the AM peak hour, 126 trips during the PM peak hour, and 625 daily trips over what was assumed in travel demand model horizon year. Trip Generation is discussed in more detail in **Section 5.1**.

13.2 CEQA Findings

VMT: The 918 dwelling unit residential component of the Project is anticipated to have home based VMT per capita of 13.6 in 2023 and 13.1 in 2040, compared to a significance threshold (calculated using the same methodology and data as the Project impacts) of 17.3. Therefore the residential component of the Project has a **less-than significant** impact on VMT. The 5,400 sqft neighborhood commercial local serving retail component of the Project offers improved destination choices for local residents and can be assumed to have a **less-than significant** impact on VMT. The VMT analysis is discussed in **Section 3.4** and **Section 11**.

Transit: The Project does not interfere with existing or proposed transit service and has a **less-than-significant** impact on transit. Transit impacts are briefly discussed in **Section 12**.

Bicycles and Pedestrians: The Project enhances bicycle and pedestrian access to the El Dorado Hills Business Park and does not interfere with existing or planned bicycle and pedestrian facilities. The Project includes a variety of bike and pedestrian amenities providing connections both within the planned community and externally to the existing bike and pedestrian facilities along Latrobe Road and Royal Oaks Dr. Therefore, the Project has a **less-than-significant** impact on bicycle and pedestrian facilities. Bicycles and pedestrian impacts are briefly discussed in **Section 12**.

13.3 General Plan Level-of-Service and Queue Length Findings

Deficiencies that are caused or worsened by the Project, and abatement measures to address said deficiencies, are identified for existing 2023 plus Project, EPAP 2033 plus Project, and cumulative 2040 plus Project conditions.

Throughout this document, segment deficiencies are numbered using the segment number (i through v) and a year code (2023 = “A”, 2033 = “B”, and 2040 = “C”). Intersection abatement measures are numbered using the intersection number (1-27) and the year code (A, B, or C).

Existing 2023 Plus Project Conditions

Existing 2023 plus Project conditions are discussed in **Section 6.** The Project is anticipated to cause new or worsen existing level-of-service/queuing deficiencies on one road segment and at twelve intersections (deficiencies may be caused by anticipated level-of-service and/or queue spillback):

1 Arterial segments with worsened or new Project related deficiencies:

- Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south) AM and PM

10 Locations that are deficient with or without the Project that are worsened:

- (2) El Dorado Hills Blvd/Saratoga Way AM and PM;
- (3) El Dorado Hills Blvd/US 50 WB AM and PM;
- (5) Latrobe Road/Town Center Boulevard PM;
- (6) Latrobe Road/White Rock Road AM and PM;
- (8) Latrobe Rd/Suncast Ln AM and PM;
- (9) Latrobe Road/ Golden Foothill Parkway (S) AM and PM;
- (10) Latrobe Road/Investment Boulevard AM and PM;
- (13) Golden Foothill Parkway (S)/Robert J. Mathewsws Pkwy PM;
- (18) White Rock Road/Carson Crossing Road PM; and
- (21) White Rock Road/Valley View Parkway AM and PM.

2 Locations where the Project is anticipated to cause new deficiencies:

- (11) Latrobe Road/Avanti Drive AM and PM; and
- (12) Latrobe Road/Royal Oaks Drive AM and PM.

Deficiency/Abatement (ii)A. Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south) in 2023 (CIP Project Latrobe 72)

Deficiency: Level-of-service is anticipated to worsen to F with the addition of Project traffic during the AM and PM peak-hours.

Abatement: Before issuance of the 658th residential building permit or the first commercial building permit, the CIP project Latrobe 72 (widen Latrobe Rd to four-lanes between Investment Blvd and Royal Oaks Dr) shall be included in the 10-year CIP. Latrobe 72 consists of widening Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south) from two-lanes to four-lanes, and all associated improvements at the intersections of Latrobe Rd/Investment Blvd and Latrobe Rd/Golden Foothill Pkwy (south).

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 18** presented the segment level-of-service results with this abatement.

Project Responsibility: The Project is responsible for its fair share of the cost of these off-site improvements which would be addressed by payment of fees after Latrobe 72 is added to the 10-year CIP. Addition of these improvements to the CIP will provide the mechanism to ensure the Project is responsible for its fair share.

Timing: Prior to issuance of the 658th residential building permit or the first commercial building permit. Note the 658 th unit constraint is based on the cumulative 2040 scenario which is the most constrained scenario for this deficiency.

Deficiency/Abatement 2A. El Dorado Hills Blvd/Saratoga Way in 2023

Deficiency: Level-of-service is F prior to addition of Project traffic, with northbound left-turn queues spilling out of the turn pocket. Project traffic is anticipated to worsen level-of-service and northbound left-turn queues.

Abatement: Construct a 300-foot southbound right turn pocket and adjust signal timing.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** presented intersection level-of-service results with this abatement.

Project Responsibility: This abatement partially implements Project #36105076 in the 10-year Capital Improvement Program (CIP). The Project may satisfy its fair share requirement through payment of applicable fees under the El Dorado County traffic impact Fee (TIF) program.

Timing: Prior to issuance of 1st building permit.

Cross reference: See abatement 2B, which builds on abatement 2A.

Deficiency/Abatement 3A. El Dorado Hills Blvd/US 50 WB in 2023

Deficiency: Existing AM peak-hour level-of-service is F prior to addition of Project traffic. Project traffic is anticipated to worsen level-of-service.

Abatement: Adjust signal splits.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** presented intersection level-of-service results with this abatement.

Project responsibility: Project is responsible for its fair-share of signal timing adjustment. The CIP includes funding for intersection and safety improvements at "to be determined" locations. The Project may satisfy this requirement through payment of applicable fees under the El Dorado County traffic impact Fee (TIF) program.

Timing: Prior to issuance of 1st building permit.

Deficiency/Abatement 5A. Latrobe Road/Town Center Boulevard in 2023

Deficiency: The southbound left turn queue spills back out of its pocket during the PM peak-hour under existing conditions prior to the addition of Project traffic. Project traffic is anticipated to worsen the southbound left turn queue spillback and cause the westbound left turn queue to exceed its pocket length.

Abatement: Adjust signal splits and extend the westbound left-turn pocket from 100 feet to 140 feet.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** presented intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for its fair share of these intersection improvements. These improvements could be addressed through the line item in the CIP for intersection improvements and the Project would contribute its fair share through payment of the TIF. Because a discrete CIP project is not approved or anticipated for the specific improvement, these intersections improvements were included within the area of potential effect (APE) for the Project.

Timing: Prior to issuance of 1st building permit.

Deficiency/Abatement 6A. Latrobe Road/White Rock Road in 2023

Deficiency: The westbound left-turn queue spills back out of its turn pocket under existing conditions without the Project. Project traffic is anticipated to worsen that queue spillback.

Abatement: Adjust signal splits.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** presented intersection level-of-service results with this abatement.

Project responsibility: This abatement partially implements Project #36105069 in the 20-year Capital Improvement Program (CIP). The Project is responsible for its fair share of

modification of signal timing, which may be addressed through payment of fees if the CIP project is moved to the 10-year CIP.

Timing: Prior to issuance of 1st building permit.

Deficiency/Abatement 8A. Latrobe Road/Suncast Lane in 2023

Deficiency: The eastbound left turn queue spills-back out of its pocket during the PM peak-hour under existing conditions prior to the addition of Project traffic. Project traffic is anticipated to worsen the existing deficiency.

Abatement: Restripe the eastbound approach to have a left and a shared left-right lane.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** presented intersection level-of-service results with this abatement.

Project responsibility: Project is responsible for its fair-share of restriping. The CIP includes funding for intersection and safety improvements at "to be determined" locations. The Project may satisfy this requirement through payment of applicable fees under the El Dorado County traffic impact Fee (TIF) program.

Timing: Prior to issuance of 1st building permit.

Deficiency/Abatement 9A. Latrobe Road/ Golden Foothill Parkway (south) in 2023

Deficiency: Project traffic is anticipated to create a new intersection level-of-service deficiency during the PM peak-hour and worsen existing queue spillback from the eastbound left turn during both the AM and PM peak-hours.

Abatement: Stripe eastbound approach as 2-lanes between Robert J. Mathewsws Pkwy and Latrobe Rd and widen to three lanes at the intersection by constructing a 200-foot eastbound right turn pocket. Label the eastbound approach lanes as left, left, thru-right. Adjust cycle length and splits. These improvements are consistent with intersection improvements that would be constructed under abatement (ii)A ("Latrobe 72") above. Therefore, addition of Latrobe 72 to the 10-year CIP would address the Project's fair share cost of these improvements as well.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** presented intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for its fair share of the cost of these off-site improvements which would be addressed by payment of fees after Latrobe 72 is added to the 10-year CIP.

Timing: Prior to issuance of 1st building permit.

Cross reference: See abatement 9B, which builds on abatement 9a.

Deficiency/Abatement 10A. Latrobe Road/Investment Boulevard in 2023

Deficiency: Project traffic is anticipated to cause the northeast bound (Investment Blvd) left turn queue to spill out of its left-turn pocket during the AM peak-hour and worsen existing queue spill back for that same movement during the PM peak-hour.

Abatement: Stripe eastbound approach as left, shared left-right in 180-foot pocket. Adjust cycle length and splits. These improvements are consistent with intersection improvements that would be constructed under abatement (ii)A ("Latrobe 72") above. Therefore, addition of Latrobe 72 to the 10-year CIP would address the Project's fair share cost of these improvements as well.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** presented intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for its fair share of the cost of these off-site improvements which would be addressed by payment of fees after Latrobe 72 is added to the 10-year CIP.

Timing: Prior to issuance of 1st building permit.

Deficiency/Abatement 11A. Latrobe Road/Avanti Drive in 2023

Deficiency: Project traffic is anticipated to cause this intersection to operate at level-of-service F.

Abatement: Construct 100-foot left turn pockets on Latrobe (NB and SB). Construct 100-foot receiving lane on NB Latrobe for EB left turns from Project. This intersection is a Project access point, and these improvements can likely be done as part of the Project's frontage improvements.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** presented intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for construction of these intersection improvements.

Timing: Prior to issuance of 1st building permit.

Deficiency/Abatement 12A. Latrobe Road/Royal Oaks Drive in 2023

Deficiency: Project traffic is anticipated to worsen the intersection to level-of-service F.

Abatement: Reconstruct the intersection as a signal-controlled intersection. The eastbound approach should be constructed as a three-lane approach with a left-turn lane in a 220-foot pocket, a shared left-thru, and a right turn lane in a 100-foot pocket. This intersection is a Project access point, and these improvements can likely be done as part of the Project's frontage improvements.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** presented intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for construction of these intersection improvements.

Timing: Prior to issuance of 1st building permit.

Deficiency/Abatement 13A. Golden Foothill Pkwy/Robert J. Mathews Pkwy in 2023

Deficiency: Project traffic is anticipated to worsen level-of-service F conditions.

Abatement: Reconstruct as a roundabout. Construct as follows:

- Northbound approach - a shared left-right lane and a right-turn lane in a 100-foot pocket.
- Westbound approach - a left-turn lane and a through lane.
- Eastbound approach – a shared through-right lane.

Figure 13 provides the traffic model's representation of this geometry and its relation to the adjacent intersection of Latrobe Rd/Golden foothill Pkwy (south) with abatement 9A implemented.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** presented intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for its fair share of the cost of these off-site improvements which would be addressed by payment of fees after the roundabout is added to the 10-year CIP.

Timing: Prior to issuance of 1st building permit.

Deficiency/Abatement 18A. White Rock Road/Carson Crossing Road in 2023

Deficiency: Project traffic is anticipated to worsen level-of-service F conditions and cause the peak-hour signal warrant to be met.

Abatement: Signalize the intersection utilizing existing geometry.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** presented intersection level-of-service results with this abatement.

Project responsibility: This off-site improvement partially implements 20-year CIP project 36105041 (White Rock Road widening 2 to 4 Lanes - Windfield Way to Sacramento County Line) and should be advanced to the 10-year CIP. Through payment of the TIF,. the Project would be responsible for its fair share of cost.

Timing: Prior to issuance of 1st building permit.

Deficiency/Abatement 21A. White Rock Road/Valley View Parkway in 2023

Deficiency: Project traffic is anticipated to worsen level-of-service to F and worsen left-turn queue spillback on eastbound and westbound White Rock Rd.

Abatement: Reconstruct White Rock Rd through the intersection as follows:

- Eastbound approach: restripe the left turn pocket to 400-feet, restripe the shared through-right lane as a through lane, construct a right-turn lane in a 220-foot pocket.
- Westbound approach (White Rock Rd): Widen to construct a right-turn lane in a 220-foot pocket and extend the left-turn pocket to 400-feet. Restripe the shared through-right lane as a through lane.

Widening should be done to the south or Latrobe Rd to avoid high voltage lines. Eastbound-westbound Lane alignment may require additional space.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 19** presented intersection level-of-service results with this abatement.

Project responsibility: CIP Project 36105042 (White Rock Road widening 2 to 4 lanes - Post Street to South of Silva Valley Parkway) includes funding for improvements to this intersection in both the 10-year and 20-year CIPs and all components should be advanced to 10-year CIP. The Project's fair share responsibility for this improvement can be met through payment of TIF program fees.

Timing: Payment of TIF at issuance of each building permit.

Cross reference: See abatement 21B, which builds on abatement 21a.

EPAP 2033 Plus Project Conditions

EPAP 2033 plus Project conditions are discussed in **Section 8.** The Project is anticipated to cause new or worsen existing level-of-service/queuing deficiencies on two road segments and at thirteen intersections (deficiencies may be caused by anticipated level-of-service and/or queue spillback):

2 Arterial segments with worsened or new Project related deficiencies:

- White Rock Rd between Valley View Pkwy to Silva Valley Pkwy AM and PM; and
- Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south) PM.

11 Locations that are deficient with or without the Project that are worsened:

- (2) El Dorado Hills Blvd/Saratoga Way AM and PM;
- (3) El Dorado Hills Blvd/US 50 WB AM and PM;
- (4) El Dorado Hills Blvd/US 50 EB PM;
- (5) Latrobe Road/Town Center Boulevard PM;
- (6) Latrobe Road/White Rock Road AM and PM;
- (7) Latrobe Road/Golden Foothill Parkway (N) AM and PM;
- (9) Latrobe Road/ Golden Foothill Parkway (S) AM and PM;
- (10) Latrobe Road/Investment Boulevard AM and PM;
- (13) Golden Foothill Parkway (S)/Robert J. Mathewsws Pkwy AM and PM;
- (18) White Rock Road/Carson Crossing Road PM; and
- (21) White Rock Road/Valley View Parkway AM and PM.

2 Locations where the Project is anticipated to cause new deficiencies:

- (11) Latrobe Road/Avanti Drive AM and PM; and
- (12) Latrobe Road/Royal Oaks Drive AM and PM.

Deficiency/Abatement (ii)B. Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south) in 2033 (CIP Project Latrobe 72)

Deficiency: Level-of-service is anticipated to worsen to F with the addition of Project traffic during the AM and PM peak-hours.

Abatement: Implement as abatement (ii)A.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 26** presented the segment level-of-service results with this abatement.

Project responsibility: None, addressed through abatement (ii)A.

Timing: Not applicable, addressed through abatement (ii)A.

Deficiency/Abatement (v)B. White Rock Rd between Valley View Pkwy to Silva Valley Pkwy in 2033

Deficiency: This segment operates at level-of-service F under EPAP 2033 conditions without the Project and the Project is anticipated to add more than 10 peak hour trips to this segment, worsening the existing level-of-service deficiency.

Abatement: Before issuance of the 173rd residential building permit or the first commercial building permit, advance CIP Project 36105042 to the 10-year CIP (widen White Rock Rd to four lanes between Valley View Pkwy and Silva Valley Pkwy.).

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 26** presented the segment level-of-service results with this abatement.

Project Responsibility: CIP Project 36105042 (White Rock Road widening 2 to 4 lanes - Post Street to South of Silva Valley Parkway) includes funding for improvements to this segment in both the 10-year and 20-year CIPs and all components should be advanced to 10-year CIP. The Project's fair share responsibility for this improvement can be met through payment of TIF program fees.

Timing: Prior to issuance of the 173rd residential building permit or the first commercial building permit.

Deficiency/Abatement 2B. El Dorado Hills Blvd/Saratoga Way in 2023

Deficiency: Level-of-service is F prior to addition of Project traffic, with northbound left-turn queues spilling out of the turn pocket. Project traffic is anticipated to worsen level-of-service and northbound left-turn queues.

2023-2033 Improvements Assumed: Southbound right-turn pocket (300-foot) and 500-foot northbound and southbound left turn pockets are assumed as part of CIP project 36105076.

Abatement: In addition to abatement 2A, prohibit northbound U-turns, overlap the eastbound right turn with the northbound left turn, and overlap the southbound right turn with the eastbound left turn.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** presented intersection level-of-service results with this abatement.

Project Responsibility: This abatement partially implements Project #36105076 in the 10-year Capital Improvement Program (CIP). The Project may satisfy this requirement through payment of applicable fees under the El Dorado County traffic impact Fee (TIF) program.

Timing: Prior to issuance of 1st building permit.

Cross reference: See abatement 2A.

Deficiency/Abatement 3B. El Dorado Hills Blvd/US 50 WB in 2033

Deficiency: AM peak-hour level-of-service is F prior to addition of Project traffic. Project traffic is anticipated to worsen level-of-service.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 3A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 3A.

Timing: Not applicable, addressed through abatement 3A.

Deficiency/Abatement 4B. El Dorado Hills Blvd/US 50 EB in 2033

Deficiency: PM peak-hour 95th percentile queue on ramp is anticipated to reach 1251-feet, ending with 500-feet of the gore-point (where the ramp exits the freeway). Project traffic is anticipated to add 172-feet to the queue. This is a potentially traffic operations issue as the 2 lane portion of the ramp is limited to 430-feet.

2023-2033 Improvements Assumed: None.

Abatement: construct a 3rd eastbound right turn lane from the offramp to southbound Latrobe Road. The new turn lane shall match the approximate length of the existing 2-lane portion of the offramp.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: CIP Project 36104001 (US 50 / Latrobe Road/ El Dorado Hills Boulevard Interchange Improvements Phase 2B) includes reconstruction of the EB diagonal on-ramp, EB on-ramp auxiliary lane, and the EB loop off-ramp. The Project is responsible for its fair share of the cost of this off-site improvement. Which would be addressed through payment of fees after widening of the eastbound diagonal offramp has been added to CIP Project 36104001.

Timing: Payment of TIF at issuance of each building permit.

Cross reference: See abatement 4C.

Deficiency/Abatement 5B. Latrobe Road/Town Center Boulevard in 2033

Deficiency: The southbound left-turn queue spills back out of its pocket during the PM peak-hour prior to the addition of Project traffic. Project traffic is anticipated to worsen the southbound left-turn queue spillback and cause the westbound left-turn queue to exceed its pocket length.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 5A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 5A.

Timing: Not applicable, addressed through abatement 5A.

Deficiency/Abatement 6B. Latrobe Road/White Rock Road in 2033

Deficiency: The westbound left-turn queue spills back out of its turn pocket. Project traffic is anticipated to worsen that queue spillback.

2023-2033 Improvements Assumed: None.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 6A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 6A.

Timing: Not applicable, addressed through abatement 6A.

Deficiency/Abatement 7B. Latrobe Road/Golden Foothill Parkway (N) in 2033

Deficiency: Project traffic is anticipated to worsen level-of-service to F.

2023-2033 Improvements Assumed: None.

Abatement: Construct 180-foot southbound right turn pocket.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** presented intersection level-of-service results with this abatement.

Project responsibility: CIP 36105069 will widen this portion of Latrobe Rd to six lanes by 2040 and should be advanced to the 10-year CIP. The Project's fair share cost of this improvement is payment of the TIF program fee.

Timing: Prior to issuance of 1st building permit.

Deficiency/Abatement 9B. Latrobe Road/ Golden Foothill Parkway (S) in 2033

Deficiency: Project traffic is anticipated to worsen the intersection to level-of-service F conditions.

2023-2033 Improvements Assumed: None.

Abatement: Abatement 9B is similar, but expands upon, abatement 9A:

- Eastbound approach: Implement abatement 9A.

- Westbound approach: Stripe westbound approach to 2-lanes between Blackstone Pkwy and Latrobe Rd, and construct a 250' right left pocket. Label the resulting three lanes as left, left, thru-right.
- Northbound approach: Widen northbound approach by constructing an additional 100' right turn pocket and extending the left turn pocket to 260'. Label the resulting four lanes as left, thru, thru, and right.
- Southbound approach: Widen southbound approach by constructing an additional 300' right turn pocket, label the resulting four lanes as left, thru, thru, right.

Figure 16 below shows the traffic model's representation of these improvements. Note that the depicted northbound right turn lane was drawn with a 24-foot width to reflect the assumed ultimate width of Latrobe Rd after widening to four lanes with the "Latrobe 72" improvements and an additional northbound through lane. The Project is not obligated to build improvements to that footprint, but it is advised that any relocation of traffic signals be placed outside of the intersection's ultimate footprint.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** presented intersection level-of-service results with this abatement.

Project responsibility: The Project is responsible for its fair share of the cost of these off-site improvements which would be addressed by payment of fees after Latrobe 72 is added to the 10-year CIP.

Timing: Prior to issuance of 1st building permit.

Cross reference: See abatement 9A.

Deficiency/Abatement 10B. Latrobe Road/Investment Boulevard in 2033

Deficiency: Project traffic is anticipated to cause the eastbound (Investment Blvd) left-turn queue to spill out of its left-turn pocket.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 10A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 10A.

Timing: Not applicable, addressed through abatement 10A.

Deficiency/Abatement 11B. Latrobe Road/Avanti Drive in 2033

Deficiency: Project traffic is anticipated to cause this intersection to operate at level-of-service F.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 11A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 11A.

Timing: Not applicable, addressed through abatement 11A.

Deficiency/Abatement 12B. Latrobe Road/Royal Oaks Drive in 2033

Deficiency: Project traffic is anticipated to worsen the intersection to level-of-service F.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 12A.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 12A.

Timing: Not applicable, addressed through abatement 12A.

Deficiency/Abatement 13B. Golden Foothill Pkwy/Robert J. Mathews Pkwy in 2033

Deficiency: The Project is anticipated to worsen existing level-of-service F conditions at this intersection.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 13A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 13A.

Timing: Not applicable, addressed through abatement 13A.

Deficiency/Abatement 18B. White Rock Road/Carson Crossing Road in 2033

Deficiency: Project traffic is anticipated to cause new and worsen level-of-service F conditions. The peak-hour signal warrant is met with or without the Project.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 18A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 27** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 18A.

Timing: Not applicable, addressed through abatement 18A.

Deficiency/Abatement 21B. White Rock Road/Valley View Parkway in 2033

Deficiency: Project traffic is anticipated to worsen level-of-service to F conditions and worsen left-turn queue spillback on eastbound and westbound White Rock Rd.

2023-2033 Improvements Assumed: None.

Abatement: Reconstruct White Rock Rd through the intersection as follows:

- Implement abatement 21 A.
- Further extend the westbound left turn pocket to 1000 feet. (Note: abatement 21A will extend this pocket to 400 feet, abatement 21B reflects an additional 600 feet of westbound right turn storage.)

Widening should be done to the south of Latrobe Rd to avoid high voltage lines. Eastbound-westbound Lane alignment may require additional space.

Finding: CIP Project 36105042 (White Rock Road widening 2 to 4 lanes - Post Street to South of Silva Valley Parkway) includes funding for improvements to this intersection in both the 10-year and 20-year CIPs and all components should be advanced to 10-year CIP. The Project's responsibility for this improvement can be met through payment of TIF program fees. With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy

deficiencies at this location. **Table 27** presented intersection level-of-service results with this abatement.

Project responsibility: CIP Project 36105042 (White Rock Road widening 2 to 4 lanes - Post Street to South of Silva Valley Parkway) includes funding for improvements to this intersection in both the 10-year and 20-year CIPs and all components should be advanced to 10-year CIP. The Project's fair share responsibility for this improvement can be met through payment of TIF program fees.

Timing: Prior to issuance of 1st building permit.

Cumulative 2040 Plus Project Conditions

Existing 2040 plus Project conditions are discussed in **Section 10.** The Project is anticipated to cause new or worsen existing level-of-service/queuing deficiencies on one road segment and at seven intersections (deficiencies may be caused by anticipated level-of-service and/or queue spillback):

1 Arterial segments with worsened or new Project related deficiencies:

- Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south) PM.

5 Locations that are deficient with or without the Project that are worsened:

- (3) El Dorado Hills Blvd/US 50 WB AM and PM;
- (4) El Dorado Hills Blvd/US 50 EB PM;
- (5) Latrobe Road/Town Center Boulevard PM;
- (9) Latrobe Road/ Golden Foothill Parkway (S) AM and PM;
- (10) Latrobe Road/Investment Boulevard AM and PM;

2 Locations where the Project is anticipated to cause new deficiencies:

- (11) Latrobe Road/Avanti Drive AM and PM; and
- (12) Latrobe Road/Royal Oaks Drive AM and PM.

Deficiency/Abatement (ii)C. Latrobe Rd between Investment Blvd and Golden Foothill Pkwy (south) in 2040 (CIP Project Latrobe 72)

Deficiency: Level-of-service is anticipated to worsen to F with the addition of Project traffic during the AM and PM peak-hours.

Abatement: Implement as abatement (ii)A.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 34** presents the segment level-of-service results with this abatement.

Project responsibility: None, addressed through abatement (ii)A.

Timing: Not applicable, addressed through abatement (ii)A.

Deficiency/Abatement 3C. El Dorado Hills Blvd/US 50 WB in 2040

Deficiency: AM peak-hour level-of-service is F prior to addition of Project traffic. Project traffic is anticipated to worsen level-of-service.

2023-2040 Improvements Assumed: 2023 CIP 36104001.

Abatement: Implement as abatement 3A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 3A.

Timing: Not applicable, addressed through abatement 3A.

Deficiency/Abatement 4C. El Dorado Hills Blvd/US 50 EB in 2040

Deficiency: PM peak-hour 95th percentile queue on ramp is anticipated to reach 1400-feet, ending with 500-feet of the gore-point (where the ramp exits the freeway). Project traffic is anticipated to add 124-feet to the queue. This is a potentially traffic operations issue as the 2-lane portion of the ramp is limited to 430-feet.

2023-2040 Improvements Assumed: 2023 CIP 36104001.

Abatement: Implement as abatement 4B

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** at the end of this section presents intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 4B.

Timing: Not applicable, addressed through abatement 4B.

Deficiency/Abatement 5C. Latrobe Road/Town Center Boulevard in 2040

Deficiency: The southbound left-turn queue spills back out of its pocket during the PM peak-hour prior to the addition of Project traffic. Project traffic is anticipated to worsen the southbound left-turn queue spillback and cause the westbound left-turn queue to exceed its pocket length.

2023-2040 Improvements Assumed: None.

Abatement: Implement as abatement 5A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 5A.

Timing: Not applicable, addressed through abatement 5A.

Deficiency/Abatement 9C. Latrobe Road/ Golden Foothill Parkway (S) in 2040

Deficiency: Project traffic is anticipated to worsen the intersection to level-of-service F conditions.

2023-2033 Improvements Assumed: None.

Abatement: Implement as abatement 9B

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 9B.

Timing: Not applicable, addressed through abatement 9B.

Cross reference: See abatement 9A, 9B.

Deficiency/Abatement 10C. Latrobe Road/Investment Boulevard in 2040

Deficiency: Project traffic is anticipated to cause the eastbound (Investment Blvd) left-turn queue to spill out of its left-turn pocket.

2023-2040 Improvements Assumed: None.

Abatement: Implement as abatement 10A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 10A.

Timing: Not applicable, addressed through abatement 10A.

Deficiency/Abatement 11C. Latrobe Road/Avanti Drive in 2040

Deficiency: Project traffic is anticipated to cause this intersection to operate at level-of-service F.

2023-2040 Improvements Assumed: None.

Abatement: Implement as abatement 11A

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 11A.

Timing: Not applicable, addressed through abatement 11A.

Deficiency/Abatement 12C. Latrobe Road/Royal Oaks Drive in 2040

Deficiency: Project traffic is anticipated to worsen the intersection to level-of-service F.

2023-2040 Improvements Assumed: None.

Abatement: Implement as abatement 12A.

Finding: With implementation of the abatement measure, the Project is not anticipated to cause new, or worsen existing, General Plan level-of-service policy deficiencies at this location. **Table 35** presented intersection level-of-service results with this abatement.

Project responsibility: None, addressed through abatement 12A.

Timing: Not applicable, addressed through abatement 12A.

Analysis ID: 1472965
Analysis: Creekside #1 4/18-27/2023
Created by: tkear@tkearinc.com
Created on: 2023-07-13
Organization: T. Kear/Creekside Village Intersection Studies

Analysis Setup Details:
Analysis Type: Turning Movement Analysis
Unit of Measurement: Miles
Mode of Travel: All Vehicles CVD+
Output Type: StL All Vehicles Volume

Analysis Options:
Data Periods: Apr 18, 2023 - Apr 27, 2023

Day Type:
0: All Days (M-Su)
1: Tues-Thurs (Tu-Th)

Day Part:
00: 6:00am-6:15am
01: 6:15am-6:30am
02: 6:30am-6:45am
03: 6:45am-7:00am
04: 7:00am-7:15am
05: 7:15am-7:30am
06: 7:30am-7:45am
07: 7:45am-8:00am
08: 8:00am-8:15am
09: 8:15am-8:30am
10: 8:30am-8:45am
11: 8:45am-9:00am
12: 9:00am-9:15am
13: 9:15am-9:30am
14: 9:30am-9:45am
15: 9:45am-10:00am
16: 3:00pm-3:15pm
17: 3:15pm-3:30pm
18: 3:30pm-3:45pm
19: 3:45pm-4:00pm
20: 4:00pm-4:15pm
21: 4:15pm-4:30pm
22: 4:30pm-4:45pm

27: 5:45pm-6:00pm
28: 6:00pm-6:15pm
29: 6:15pm-6:30pm
30: 6:30pm-6:45pm
31: 6:45pm-7:00pm

Country: USA
Metrics Version: R125-M127

Metric results for this analysis include rows generated using an upsampling technique that uses data from adjacent day parts and analogous day parts outside of the original data period to synthesize a representative metric in cases where sample size would have been otherwise too low to provide a high-quality result. Please contact support@streetlightdata.com with any questions.

Analysis ID: 1472961
Analysis: Creekside #2 4/18-27/2023
Created by: tkear@tkearinc.com
Created on: 2023-07-13
Organization: T. Kear/Creekside Village Intersection Studies

Analysis Setup Details:
Analysis Type: Turning Movement Analysis
Unit of Measurement: Miles
Mode of Travel: All Vehicles CVD+
Output Type: StL All Vehicles Volume

Analysis Options:
Data Periods: Apr 18, 2023 - Apr 27, 2023

Day Type:
0: All Days (M-Su)
1: Tues-Thurs (Tu-Th)

Day Part:
00: 6:00am-6:15am
01: 6:15am-6:30am
02: 6:30am-6:45am
03: 6:45am-7:00am
04: 7:00am-7:15am
05: 7:15am-7:30am
06: 7:30am-7:45am
07: 7:45am-8:00am
08: 8:00am-8:15am
09: 8:15am-8:30am
10: 8:30am-8:45am
11: 8:45am-9:00am
12: 9:00am-9:15am
13: 9:15am-9:30am
14: 9:30am-9:45am
15: 9:45am-10:00am
16: 3:00pm-3:15pm
17: 3:15pm-3:30pm
18: 3:30pm-3:45pm
19: 3:45pm-4:00pm
20: 4:00pm-4:15pm
21: 4:15pm-4:30pm
22: 4:30pm-4:45pm
23: 4:45pm-5:00pm
24: 5:00pm-5:15pm
25: 5:15pm-5:30pm
26: 5:30pm-5:45pm
27: 5:45pm-6:00pm
28: 6:00pm-6:15pm
29: 6:15pm-6:30pm
30: 6:30pm-6:45pm
31: 6:45pm-7:00pm

Country: USA
Metrics Version: R125-M127

Metric results for this analysis include rows generated using an upsampling technique that uses data from adjacent day parts and analogous day parts outside of the original data period to synthesize a representative metric in cases where sample size would have been otherwise too low to provide a high-quality result. Please contact support@streetlightdata.com with any questions.

Country: USA
Metrics Version: R125-M127

Metric results for this analysis include rows generated using an upsampling technique that uses data from adjacent day parts and analogous day parts outside of the original data period to synthesize a representative metric in cases where sample size would have been otherwise too low to provide a high-quality result. Please contact support@streetlightdata.com with any questions.

Country: USA
Metrics Version: R125-M127

Metric results for this analysis include rows generated using an upsampling technique that uses data from adjacent day parts and analogous day parts outside of the original data period to synthesize a representative metric in cases where sample size would have been otherwise too low to provide a high-quality result. Please contact support@streetlightdata.com with any questions.

Analysis ID: 1473000
Analysis: Creekside #7 4/18-27/2023
Created by: tkear@tkearinc.com
Created on: 2023-07-13
Organization: T. Kear/Creekside Village Intersection Studies

Analysis Setup Details:
Analysis Type: Turning Movement Analysis
Unit of Measurement: Miles
Mode of Travel: All Vehicles CVD+
Output Type: StL All Vehicles Volume

Analysis Options:
Data Periods: Apr 18, 2023 - Apr 27, 2023

Day Type:
0: All Days (M-Su)
1: Tues-Thurs (Tu-Th)

Day Part:
00: 6:00am-6:15am
01: 6:15am-6:30am
02: 6:30am-6:45am
03: 6:45am-7:00am
04: 7:00am-7:15am
05: 7:15am-7:30am
06: 7:30am-7:45am
07: 7:45am-8:00am
08: 8:00am-8:15am
09: 8:15am-8:30am
10: 8:30am-8:45am
11: 8:45am-9:00am
12: 9:00am-9:15am
13: 9:15am-9:30am
14: 9:30am-9:45am
15: 9:45am-10:00am
16: 3:00pm-3:15pm
17: 3:15pm-3:30pm
18: 3:30pm-3:45pm
19: 3:45pm-4:00pm
20: 4:00pm-4:15pm
21: 4:15pm-4:30pm
22: 4:30pm-4:45pm
23: 4:45pm-5:00pm
24: 5:00pm-5:15pm
25: 5:15pm-5:30pm
26: 5:30pm-5:45pm
27: 5:45pm-6:00pm
28: 6:00pm-6:15pm
29: 6:15pm-6:30pm
30: 6:30pm-6:45pm
31: 6:45pm-7:00pm

Country: USA
Metrics Version: R125-M127

Metric results for this analysis include rows generated using an upsampling technique that uses data from adjacent day parts and analogous day parts outside of the original data period to synthesize a representative metric in cases where sample size would have been otherwise too low to provide a high-quality result. Please contact support@streetlightdata.com with any questions.

Analysis ID: 1473003
Analysis: Creekside #8 4/18-27/2023
Created by: tkear@tkearinc.com
Created on: 2023-07-13
Organization: T. Kear/Creekside Village Intersection Studies

Analysis Setup Details:
Analysis Type: Turning Movement Analysis
Unit of Measurement: Miles
Mode of Travel: All Vehicles CVD+
Output Type: StL All Vehicles Volume

Analysis Options:
Data Periods: Apr 18, 2023 - Apr 27, 2023

Day Type:
0: All Days (M-Su)
1: Tues-Thurs (Tu-Th)

Day Part:
00: 6:00am-6:15am
01: 6:15am-6:30am
02: 6:30am-6:45am
03: 6:45am-7:00am
04: 7:00am-7:15am
05: 7:15am-7:30am
06: 7:30am-7:45am
07: 7:45am-8:00am
08: 8:00am-8:15am
09: 8:15am-8:30am
10: 8:30am-8:45am
11: 8:45am-9:00am
12: 9:00am-9:15am
13: 9:15am-9:30am
14: 9:30am-9:45am
15: 9:45am-10:00am
16: 3:00pm-3:15pm
17: 3:15pm-3:30pm
18: 3:30pm-3:45pm
19: 3:45pm-4:00pm
20: 4:00pm-4:15pm
21: 4:15pm-4:30pm
22: 4:30pm-4:45pm
23: 4:45pm-5:00pm
24: 5:00pm-5:15pm
25: 5:15pm-5:30pm
26: 5:30pm-5:45pm
27: 5:45pm-6:00pm
28: 6:00pm-6:15pm
29: 6:15pm-6:30pm
30: 6:30pm-6:45pm
31: 6:45pm-7:00pm

Country: USA
Metrics Version: R125-M127

Metric results for this analysis include rows generated using an upsampling technique that uses data from adjacent day parts and analogous day parts outside of the original data period to synthesize a representative metric in cases where sample size would have been otherwise too low to provide a high-quality result. Please contact support@streetlightdata.com with any questions.

Analysis ID: 1475494
Analysis: Creekside #9 4/18-27/2023
Created by: tkear@tkearinc.com
Created on: 2023-07-19
Organization: T. Kear/Creekside Village Intersection Studies

Analysis Setup Details:
Analysis Type: Turning Movement Analysis
Unit of Measurement: Miles
Mode of Travel: All Vehicles CVD+
Output Type: StL All Vehicles Volume

Analysis Options:
Data Periods: Apr 18, 2023 - Apr 27, 2023

Day Type:
0: All Days (M-Su)
1: Tues-Thurs (Tu-Th)

Day Part:
00: 6:00am-6:15am
01: 6:15am-6:30am
02: 6:30am-6:45am
03: 6:45am-7:00am
04: 7:00am-7:15am
05: 7:15am-7:30am
06: 7:30am-7:45am
07: 7:45am-8:00am
08: 8:00am-8:15am
09: 8:15am-8:30am
10: 8:30am-8:45am
11: 8:45am-9:00am
12: 9:00am-9:15am
13: 9:15am-9:30am
14: 9:30am-9:45am
15: 9:45am-10:00am
16: 3:00pm-3:15pm
17: 3:15pm-3:30pm
18: 3:30pm-3:45pm
19: 3:45pm-4:00pm
20: 4:00pm-4:15pm
21: 4:15pm-4:30pm
22: 4:30pm-4:45pm
23: 4:45pm-5:00pm
24: 5:00pm-5:15pm
25: 5:15pm-5:30pm
26: 5:30pm-5:45pm
27: 5:45pm-6:00pm
28: 6:00pm-6:15pm
29: 6:15pm-6:30pm
30: 6:30pm-6:45pm
31: 6:45pm-7:00pm

Country: USA
Metrics Version: R126-M128

Metric results for this analysis include rows generated using an upsampling technique that uses data from adjacent day parts and analogous day parts outside of the original data period to synthesize a representative metric in cases where sample size would have been otherwise too low to provide a high-quality result. Please contact support@streetlightdata.com with any questions.

Organization: T. Kear/Creekside Village Intersection Studies

Analysis Setup Details:
Analysis Type: Turning Movement Analysis
Unit of Measurement: Miles
Mode of Travel: All Vehicles CVD+
Output Type: StL All Vehicles Volume

Analysis Options:
Data Periods: Apr 18, 2023 - Apr 27, 2023

Day Type:
0: All Days (M-Su)
1: Tues-Thurs (Tu-Th)

Day Part:
00: 6:00am-6:15am
01: 6:15am-6:30am
02: 6:30am-6:45am
03: 6:45am-7:00am
04: 7:00am-7:15am
05: 7:15am-7:30am
06: 7:30am-7:45am
07: 7:45am-8:00am
08: 8:00am-8:15am
09: 8:15am-8:30am
10: 8:30am-8:45am
11: 8:45am-9:00am
12: 9:00am-9:15am
13: 9:15am-9:30am
14: 9:30am-9:45am
15: 9:45am-10:00am
16: 3:00pm-3:15pm
17: 3:15pm-3:30pm
18: 3:30pm-3:45pm
19: 3:45pm-4:00pm
20: 4:00pm-4:15pm
21: 4:15pm-4:30pm
22: 4:30pm-4:45pm
23: 4:45pm-5:00pm
24: 5:00pm-5:15pm
25: 5:15pm-5:30pm
26: 5:30pm-5:45pm
27: 5:45pm-6:00pm
28: 6:00pm-6:15pm
29: 6:15pm-6:30pm
30: 6:30pm-6:45pm
31: 6:45pm-7:00pm

Country: USA
Metrics Version: R126-M128

Metric results for this analysis include rows generated using an upsampling technique that uses data from adjacent day parts and analogous day parts outside of the original data period to synthesize a representative metric in cases where sample size would have been otherwise too low to provide a high-quality result. Please contact support@streetlightdata.com with any questions.

Analysis ID: 1473016
Analysis: Creekside #14 4/18-27/2023
Created by: tkear@tkearinc.com
Created on: 2023-07-14
Organization: T. Kear/Creekside Village Intersection Studies

Analysis Setup Details:
Analysis Type: Turning Movement Analysis
Unit of Measurement: Miles
Mode of Travel: All Vehicles CVD+
Output Type: StL All Vehicles Volume

Analysis Options:
Data Periods: Apr 18, 2023 - Apr 27, 2023

Day Type:
0: All Days (M-Su)
1: Tues-Thurs (Tu-Th)

Day Part:
00: 6:00am-6:15am
01: 6:15am-6:30am
02: 6:30am-6:45am
03: 6:45am-7:00am
04: 7:00am-7:15am
05: 7:15am-7:30am
06: 7:30am-7:45am
07: 7:45am-8:00am
08: 8:00am-8:15am
09: 8:15am-8:30am
10: 8:30am-8:45am
11: 8:45am-9:00am
12: 9:00am-9:15am
13: 9:15am-9:30am
14: 9:30am-9:45am
15: 9:45am-10:00am
16: 3:00pm-3:15pm
17: 3:15pm-3:30pm
18: 3:30pm-3:45pm
19: 3:45pm-4:00pm
20: 4:00pm-4:15pm
21: 4:15pm-4:30pm
22: 4:30pm-4:45pm
23: 4:45pm-5:00pm
24: 5:00pm-5:15pm
25: 5:15pm-5:30pm
26: 5:30pm-5:45pm
27: 5:45pm-6:00pm
28: 6:00pm-6:15pm
29: 6:15pm-6:30pm
30: 6:30pm-6:45pm
31: 6:45pm-7:00pm

Country: USA
Metrics Version: R125-M127

Metric results for this analysis include rows generated using an upsampling technique that uses data from adjacent day parts and analogous day parts outside of the original data period to synthesize a representative metric in cases where sample size would have been otherwise too low to provide a high-quality result. Please contact support@streetlightdata.com with any questions.

30: 6:30pm-6:45pm
31: 6:45pm-7:00pm

Country: USA
Metrics Version: R125-M127

Metric results for this analysis include rows generated using an upsampling technique that uses data from adjacent day parts and analogous day parts outside of the original data period to synthesize a representative metric in cases where sample size would have been otherwise too low to provide a high-quality result. Please contact support@streetlightdata.com with any questions.

Analysis ID: 1473497
Analysis: Creekside #20 4/18-27/2023
Created by: tkear@tkearinc.com
Created on: 2023-07-17
Organization: T. Kear/Creekside Village Intersection Studies

Analysis Setup Details:
Analysis Type: Turning Movement Analysis
Unit of Measurement: Miles
Mode of Travel: All Vehicles CVD+
Output Type: StL All Vehicles Volume

Analysis Options:
Data Periods: Apr 18, 2023 - Apr 27, 2023

Day Type:
0: All Days (M-Su)
1: Tues-Thurs (Tu-Th)

Day Part:
00: 6:00am-6:15am
01: 6:15am-6:30am
02: 6:30am-6:45am
03: 6:45am-7:00am
04: 7:00am-7:15am
05: 7:15am-7:30am
06: 7:30am-7:45am
07: 7:45am-8:00am
08: 8:00am-8:15am
09: 8:15am-8:30am
10: 8:30am-8:45am
11: 8:45am-9:00am
12: 9:00am-9:15am
13: 9:15am-9:30am
14: 9:30am-9:45am
15: 9:45am-10:00am
16: 3:00pm-3:15pm
17: 3:15pm-3:30pm
18: 3:30pm-3:45pm
19: 3:45pm-4:00pm
20: 4:00pm-4:15pm
21: 4:15pm-4:30pm
22: 4:30pm-4:45pm
23: 4:45pm-5:00pm
24: 5:00pm-5:15pm
25: 5:15pm-5:30pm
26: 5:30pm-5:45pm
27: 5:45pm-6:00pm
28: 6:00pm-6:15pm
29: 6:15pm-6:30pm
30: 6:30pm-6:45pm
31: 6:45pm-7:00pm

Country: USA
Metrics Version: R125-M127

Metric results for this analysis include rows generated using an upsampling technique that uses data from adjacent day parts and analogous day parts outside of the original data period to synthesize a representative metric in cases where sample size would have been otherwise too low to provide a high-quality result. Please contact support@streetlightdata.com with any questions.

The conflict monitor program card is supplied with all 120 diodes installed. Diodes for phases **NOT** in conflict must be removed.

1. Mark channels (phases) that are not conflicting.
2. Remove corresponding diodes from diode board.
3. Mark diode board with name of intersection.

7						

The conflict monitor program card is supplied with all 120 diodes installed. Diodes for phases NOT in conflict must be removed.

1. Mark channels (phases) that are not conflicting.
2. Remove corresponding diodes from diode board.
3. Mark diode board with name of intersection.
