

# El Dorado County Pavement Condition Report

The El Dorado County road system is one of the most valuable assets owned and maintained by the County. The road system not only encompasses the roads but it also includes bridges, guard rails, traffic signs, traffic signals, culverts, storm drains, sidewalks and curbs and gutters. The County road system is vital to public safety, economic activity and quality of life.

The County's road system suffers damage every day of the year. Sun, rain, cold, heat, water and ice damage the asphalt, aggregates and subgrade. Traffic, especially heavy trucks, open cracks and deform the roadbed. Snow removal equipment and vehicle traction devices crush and abrade surfaces. Salt and other chemicals corrode culverts, guard rails and other metal structures. Roadway sand, trash and vegetation disrupts drainage and clogs culverts and sediment traps. These natural and man-made impacts continually damage the County's road system necessitating constant maintenance, repair and rehabilitation.

What do you do if you do not have enough money to maintain, repair or rehabilitate the entire road system? How do you decide which roads or structures are fixed? What is going to happen to the portions of the road system left unmaintained? How much is it going to cost? These important but difficult questions must be answered. El Dorado County's road system costs tens of millions of dollars annually to maintain. An efficient and cost effective management system is needed to assist the County's decision makers in choosing which roads to fix and what is the total cost of that choice.

El Dorado County's Roadway System consists of 1,834 roads with an approximate centerline length of 1,075 miles. The elevation of the system varies from 500 feet to over 7,000 feet. Roadway traffic ranges from less than one to over 30,000 cars per day. Precipitation includes rain, hail, sleet, freezing rain and snow. Temperatures vary from -20 degrees to 112 degrees Fahrenheit. Road surfaces consist of asphalt, concrete chip seal and gravel. The El Dorado County road system is complex, expensive, and constantly aging. If you only have limited funds, how do you make the necessary decisions on what sections or structures will be maintained, repaired or replaced?

In the past, agencies and elected leaders have used the expertise of their maintenance staff to determine priorities. This system worked but was not the most efficient and cost effective strategy, especially when applied to a large complex road system. Because even small gains in efficiency can have a dramatic effect on total costs, public agencies have developed new, efficient and cost effective management systems. These systems, called Pavement Management Systems or Programs (PMP), assist in decision-making by providing;

- An accurate inventory of the condition of each item in the road system
- A history of all the treatments performed on each item
- The costs to maintain, repair or rebuild each item
- The cost effectiveness of each treatment
- Predictions on how the pavement conditions will change with time depending on budgeted funding levels.

An automobile analogy can be used to illustrate the role of a Pavement Management Program. The Community Development Agency's Transportation Division is the automobile. This includes the physical components of the system as well as all of the internal processes necessary for proper functioning of the system. The County Board of Supervisors, agency staff and County citizens, are the drivers. The drivers must be able to see where to go, what is around them and what is ahead of the automobile. A Pavement Management Program provides the drivers the needed vision. First, a functional Pavement Management Program provides a complete road system inventory which includes a consistent, statistically based and impartial assessment of the condition of each item in the system. Second, a Pavement Management Program provides a look ahead. The program uses historical inspection information to calculate future roadway and structure conditions. The program can calculate costs to maintain the roads at whatever pavement condition level is desired. The program can also calculate the most cost efficient treatment for any budgeted amount. The program provides decision-makers with accurate projected outcomes based on budget, time and planned treatments.

### **Where is the County now?**

The condition assessment process that the County uses is statistically based, nonbiased, and impartial. The process provides agency staff and elected officials with information necessary to prioritize work and make cost effective decisions. This standardized inspection process is used throughout the United States and is the process that is required to obtain federal and state money for roadway construction, rehabilitation and maintenance. The process is described in Appendix 1. The County inspects each roadway every three years. The inspection information is then used to calculate the condition of each road. A roadway's condition is ranked on a scale of one to one hundred, with one hundred being the best condition. A roadway with a PCI of 70 or less is considered eligible for rehabilitation, whereas a roadway with a PCI over 70 should require only preventive maintenance. El Dorado County's roads have been divided into sections which are the same age, and have the same surface treatment and structural section. The condition of all of El Dorado County roadway sections are listed in appendix 2. The following map shows the current PCIs for each roadway section.

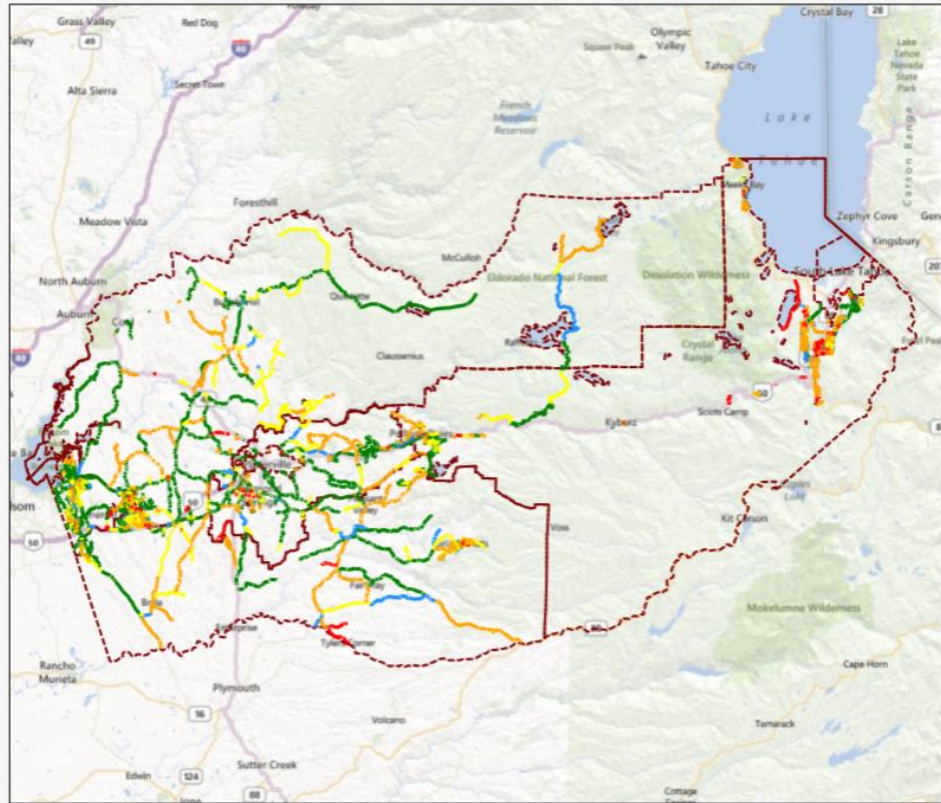

El Dorado County

# Current PCI Condition

Printed: 3/20/2014

## Feature Legend

- I - Very Good
- II - Good (non-load)
- III - Good (load-related)
- IV - Poor
- V - Very Poor

Currently El Dorado County's road system has an average Pavement Condition Index (PCI) of 64.

What does an average PCI of 64 mean? While the PCI is still considered in the good category, the pavement is at the point in the roadway life cycle where it is rapidly deteriorating. The picture below was taken on Allendale Place in El Dorado Hills. This segment of roadway has a PCI of 64. The roadway has cracked and water is beginning to enter the base and subgrade. Some areas of roadway have weakened and are unable to support traffic. The area around the manhole has settled and the surface of the roadway is no longer smooth. However, there are areas that are still in good condition. The curb and gutters are still performing as designed and there are no deep ruts or pot holes.

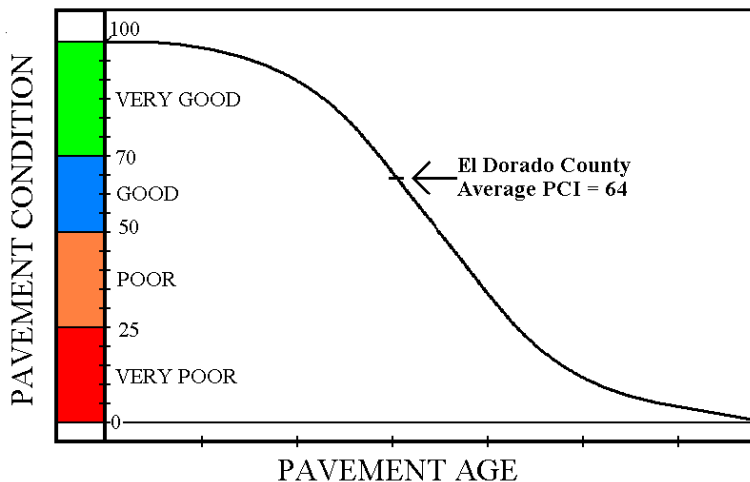

The areas of this roadway that are cracking need to be repaired and the entire surface needs to be slurry or chip sealed. If this maintenance is not done soon the cost to repair this road will rapidly increase.

An effective Pavement Management Program identifies the condition of each road, the treatment necessary to repair each road, and the costs to perform each needed treatment.

### What Lies ahead for the County's Roadway System?

The County's roadways constantly deteriorate. When a road is first constructed or reconstructed this deterioration occurs slowly. Over time the asphalt ages, cracks develop and deterioration accelerates due to water penetration and subgrade damage. Eventually, if no maintenance is performed the roadway will deteriorate to the point at which it is considered failed. At that point deterioration slows because there is little surface treatment left.

If no maintenance, repair and reconstruction is performed on the roadways, the PCI decreases about 2 points per year. So in ten years the average PCI for the El Dorado County roadway system will deteriorate from a 64 to 44.

## **Conclusion**

The El Dorado County Roadway system is one of the most valuable asset owned and maintained by the County. Using proven, cost effective management strategies is a powerful tool to manage the roadway system efficiently. An effective Pavement Management Program is one such strategy. It can help determine priorities, manage costs and predict future conditions.

## Appendix 1

### Pavement Condition Inventory

El Dorado County has approximately 1,075 miles of maintained roadway, of which 53 miles is unsurfaced. The surfaced roadway is divided into 2,256 sections. Each section is the same age, has the same surface treatment and has the same structural section. For inspection purposes, the sections are divided into 1,000 foot subsections. For each 1000 foot subsection of roadway, a random non-biased 100 foot sample is examined for typical roadway problems. For each problem that is identified, a severity and extent is measured. This information is then used to calculate the condition of the pavement. This method of inspection assures a consistent, accurate, non-biased assessment of pavement condition. The inspections are performed on a regular basis so that accurate up-to-date information is available to the agency, elected officials and County citizens. Pavement problems that are measured during a roadway inspection:

Alligator Cracking	Longitudinal and Transverse Cracking
Bleeding	Patch and Utility Cut Patching
Block Cracking	Polished Aggregate
Bumps and Sags	Potholes
Rutting	Railroad Crossing
Corrugation	Shoving
Depression	Slipping Cracking
Edge Cracking	Swell
Joint Reflection Cracking	Raveling
Lane/Shoulder Drop Off	

## Appendix B

The following is a detailed listing of the current condition or PCI of each County roadway segment.
